| Addr1 | The PHY device address, programmed with ENET _n _MMFR[PA]. Up to 32 devices can be addressed. |
| Addr2 | Register address, programmed with ENET _n _MMFR[RA]. Each PHY can implement up to 32 registers. |

Table continues on the next page...

Table 23-94. MDIO frame field descriptions (continued)

| Field | Description |
|-------|--|
| TA | Turnaround time, programmed with ENET n _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase. |
| Data | 16 bits of data, set to ENET n _MMFR[DATA]. Written to or read from the PHY |
| Idle | The MDIO data signal is tri-stated between frames. |

23.5.17.2 MDIO clock generation

The MDC clock is generated from the internal bus clock divided by the value programmed in ENET n _MSCR[MII_SPEED].

23.5.17.3 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET n _MMFR) according to the description provided in MII Management Frame Register (ENET n _MMFR).

To check when the programmed access completes, read the ENET n _EIR[MII] field.

**Figure 23-68. MDIO access overview**

23.5.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)

- RMII 10/100 using interface converters/gaskets
- RGMII 10/100/1000 by way of interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

| Mode | ECR[SPEED] | RCR[RMII_10T] | RCR[RMII_MODE] | RCR[RGMIEN] |
|-------------------------------|------------|---------------|----------------|-------------|
| MII - 10 Mbit/s ¹ | 0 | — | 0 | 0 |
| MII - 100 Mbit/s ¹ | 0 | — | 0 | 0 |
| RMII - 10 Mbit/s | 0 | 1 | 1 | 0 |
| RMII - 100 Mbit/s | 0 | 0 | 1 | 0 |
| RGMII - 10 Mbit/s | 0 | 1 | 0 | 1 |
| RGMII - 100 Mbit/s | 0 | 0 | 0 | 1 |
| RGMII - 1000 Mbit/s | 1 | — | 0 | 1 |

23.5.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

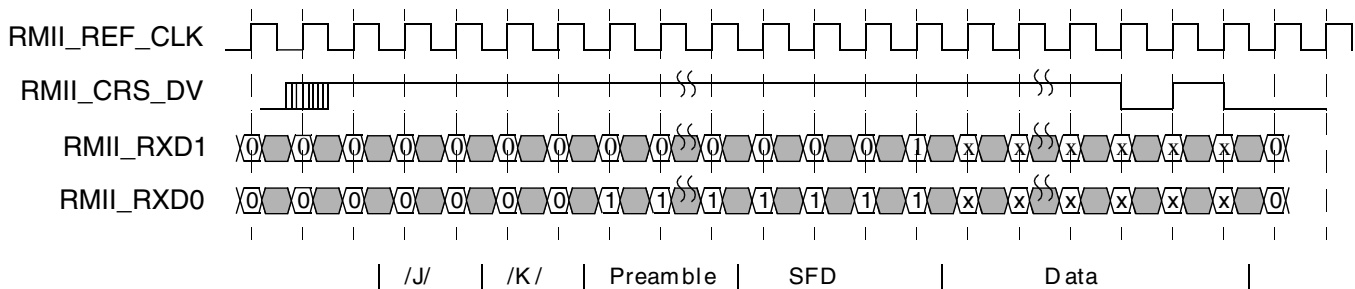

Figure 23-69. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

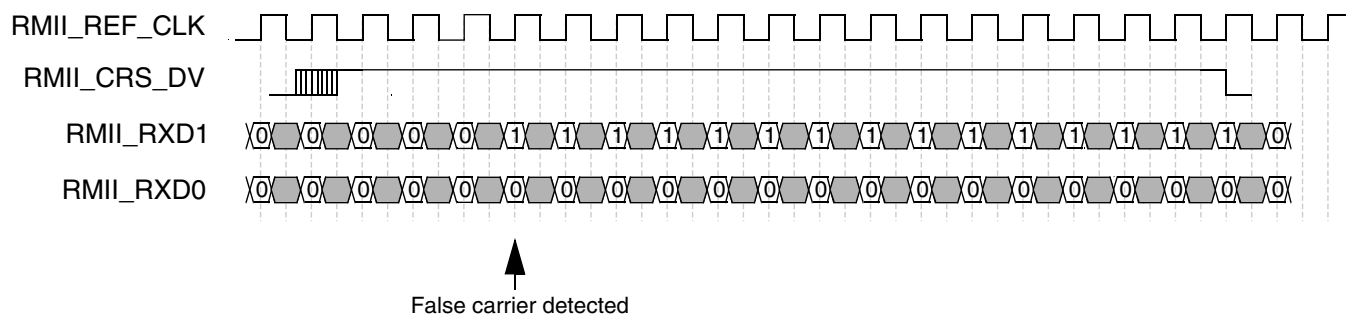

Figure 23-70. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

Figure 23-71. RMII transmit operation

23.5.18.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

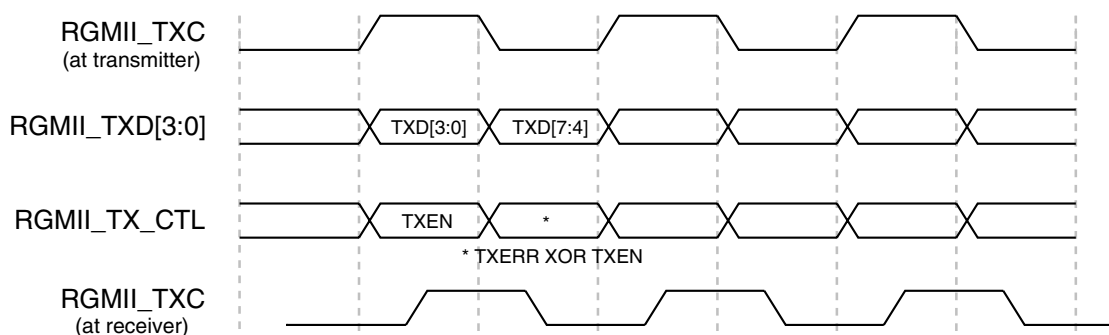

Figure 23-72. RGMII transmit operation

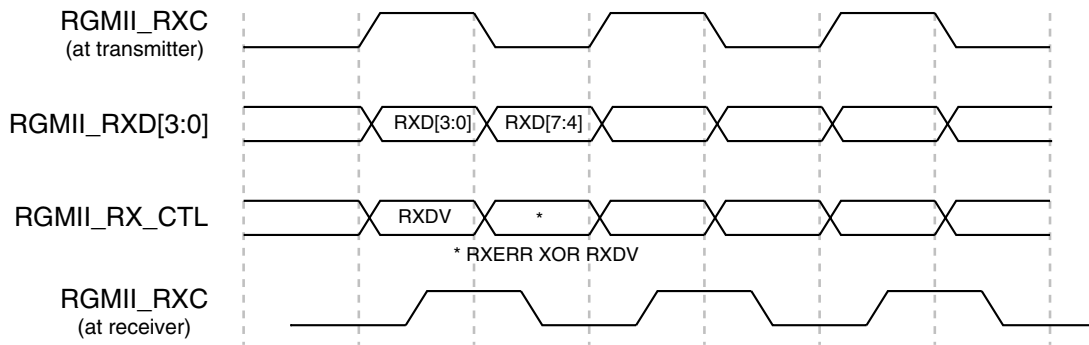

Figure 23-73. RGMII receive operation

23.5.18.3 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

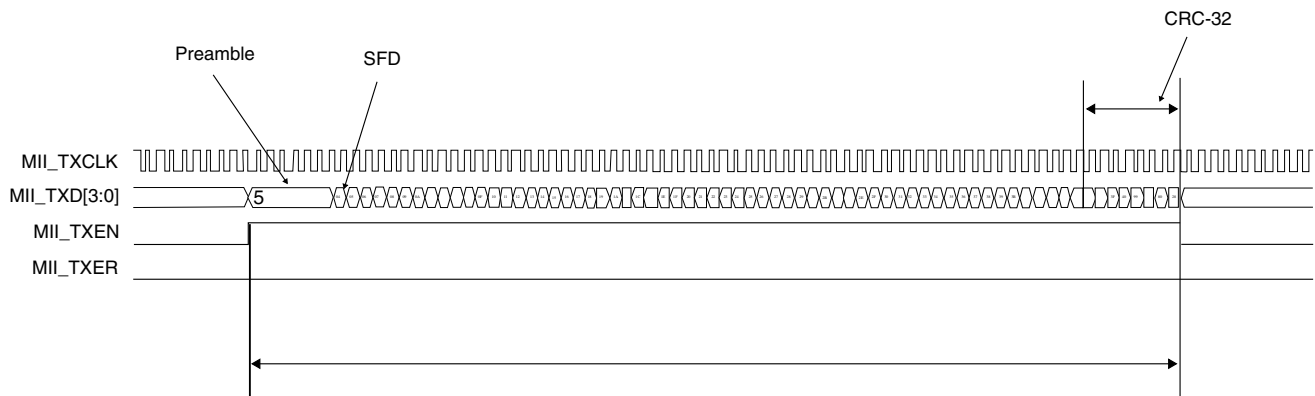

Figure 23-74. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

Figure 23-75. MII transmit operation — errored frame

23.5.18.3.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See [Collision detection in half-duplex mode](#) for details)

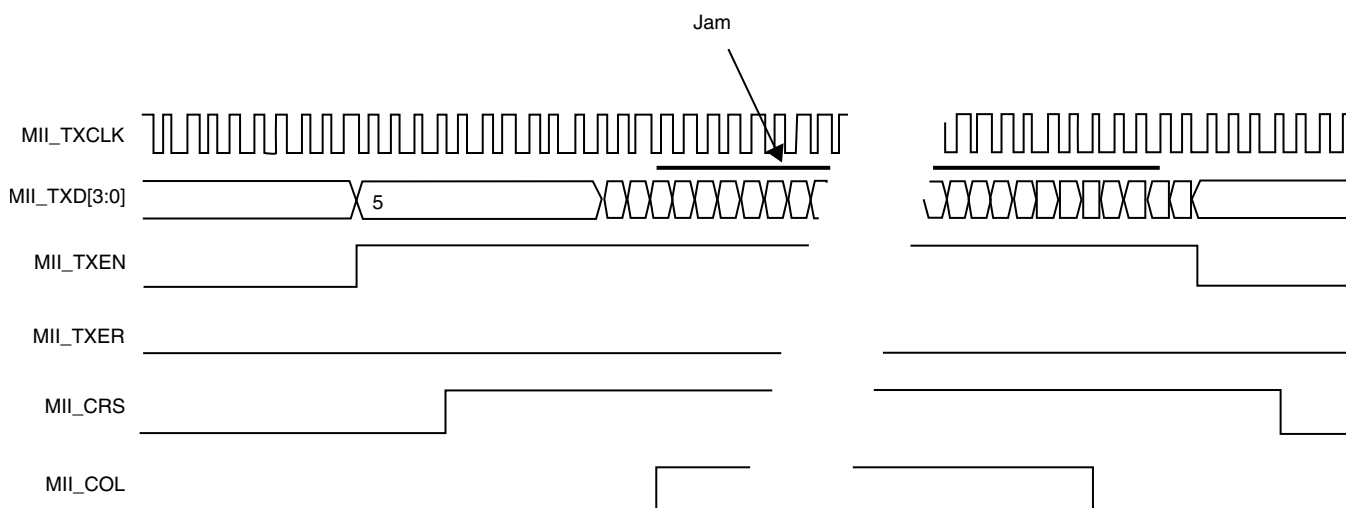

Figure 23-76. MII transmit operation — transmission with collision

23.5.18.4 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

Figure 23-77. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

Figure 23-78. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxB_D[ME] set.

Chapter 24

Enhanced Periodic Interrupt Timer (EPIT)

24.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

Figure 24-1. EPIT block diagram

24.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

24.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- [Operating in set-and-forget mode](#)
- [Operating in free-running mode](#)

See [Operations](#) for a description of the operations that EPIT supports.

24.2 External signals

The following table describes EPIT's I/O signals.

Table 24-1. EPIT External Signals

| Signal | Description | Pad | Mode | Direction |
|-----------|--|---------|------|-----------|
| EPIT1_OUT | Output 1 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition. | EIM_D19 | ALT6 | O |
| | | GPIO_0 | ALF4 | |
| | | GPIO_7 | ALT2 | |
| EPIT2_OUT | Output 2 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition. | EIM_D20 | ALT6 | O |
| | | GPIO_8 | ALT2 | |

24.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 24-2. EPIT Clocks

| Clock name | Clock Root | Description |
|------------------|--------------------|---------------------------------------|
| ipg_clk | ipg_clk_root | Peripheral clock |
| ipg_clk_32k | ckil_sync_clk_root | Low-frequency reference clock (32kHz) |
| ipg_clk_highfreq | perclk_clk_root | High-frequency reference clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg_clk_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg_clk_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32kHz crystal.

- **Peripheral clock (ipg_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

Figure 24-2. Prescaler Value Change Diagram

24.4 Functional Description

This section provides a complete functional description of the block.

24.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT_CR[RLD] to select the desired mode.

24.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT_CR).

In this mode, the counter obtains its data from the load register (EPIT_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT_CR[IOVW]) and write to EPIT_LR with the required initialization value.

24.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT_EPITCL[IOVW]) and write to EPIT_EPITLR with the required initialization value.

24.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

24.4.3 Compare Event

When the programmed value of EPIT_EPITCMPR matches the value in EPIT_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIE bit is set in the control register.

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

Figure 24-3. Compare Event and Interrupt Timing Diagram

EPIT will generate a compare event in the next count if the EPITx_CNR from the previous count equals the new EPITx_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx_CMPR to previous EPITx_CNR+1. Or, in set and forget mode, configure EPITx_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx_CNR.

24.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

24.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

24.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

24.5 Initialization/ Application Information

24.5.1 Change of Clock Source

The CLKSRC field in EPIT_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT_EPITCR.
5. Clear the EPIT status register (EPIT_EPITSR), that is, write "1" to clear (w1c).

6. Set ENMOD= 1 in the EPIT_EPITCR, to bring the EPIT Counter to defined state (EPIT_EPITLR value or 0xFFFF_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT_EPITCR
8. Enable the EPIT interrupts.

24.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

EPIT memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|-------------------------------|-----------------|--------|-------------|-----------------------------|
| 20D_0000 | Control register (EPIT1_CR) | 32 | R/W | 0000_0000h | 24.6.1/1192 |
| 20D_0004 | Status register (EPIT1_SR) | 32 | R/W | 0000_0000h | 24.6.2/1195 |
| 20D_0008 | Load register (EPIT1_LR) | 32 | R/W | FFFF_FFFFh | 24.6.3/1196 |
| 20D_000C | Compare register (EPIT1_CMPR) | 32 | R/W | 0000_0000h | 24.6.4/1196 |
| 20D_0010 | Counter register (EPIT1_CNR) | 32 | R | FFFF_FFFFh | 24.6.5/1197 |
| 20D_4000 | Control register (EPIT2_CR) | 32 | R/W | 0000_0000h | 24.6.1/1192 |
| 20D_4004 | Status register (EPIT2_SR) | 32 | R/W | 0000_0000h | 24.6.2/1195 |
| 20D_4008 | Load register (EPIT2_LR) | 32 | R/W | FFFF_FFFFh | 24.6.3/1196 |
| 20D_400C | Compare register (EPIT2_CMPR) | 32 | R/W | 0000_0000h | 24.6.4/1196 |
| 20D_4010 | Counter register (EPIT2_CNR) | 32 | R | FFFF_FFFFh | 24.6.5/1197 |

24.6.2 Control register (EPITx_CR)

The EPIT control register (EPIT_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------|----|----|----|----|----|----|----|--------|----|----|--------|----|--------|-------|------|-----|
| R | 0 | | | | | | | CLKSRC | OM | | STOPEN | 0 | WAITEN | DBGEN | IOVW | SWR |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

EPITx_SR field descriptions

| Field | Description |
|------------------|--|
| 31–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 OCIF | Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit. 0 Compare event has not occurred 1 Compare event occurred |

24.6.4 Load register (EPITx_LR)

The EPIT load register (EPIT_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT_CR is set. If the IOVW bit in the EPIT_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

EPITx_CMPR field descriptions

| Field | Description |
|-----------------|---|
| 31–0 COMPARE | Compare Value. When the counter value equals this bit field value a compare event is generated. |

24.6.6 Counter register (EPITx_CNR)

The EPIT counter register (EPIT_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT_CR is set, the value of this register can be overwritten with a write to EPIT_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

Chapter 25

Enhanced Serial Audio Interface (ESAI)

25.1 Overview

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, Sony/Phillips Digital Interface (SPDIF) transceivers, and other DSPs.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. It is a superset of the 56300 Family ESSI peripheral and of the 56000 Family SAI peripheral.

All serial transfers in the module are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is similar in that it is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The following figure shows the ESAI block diagram.

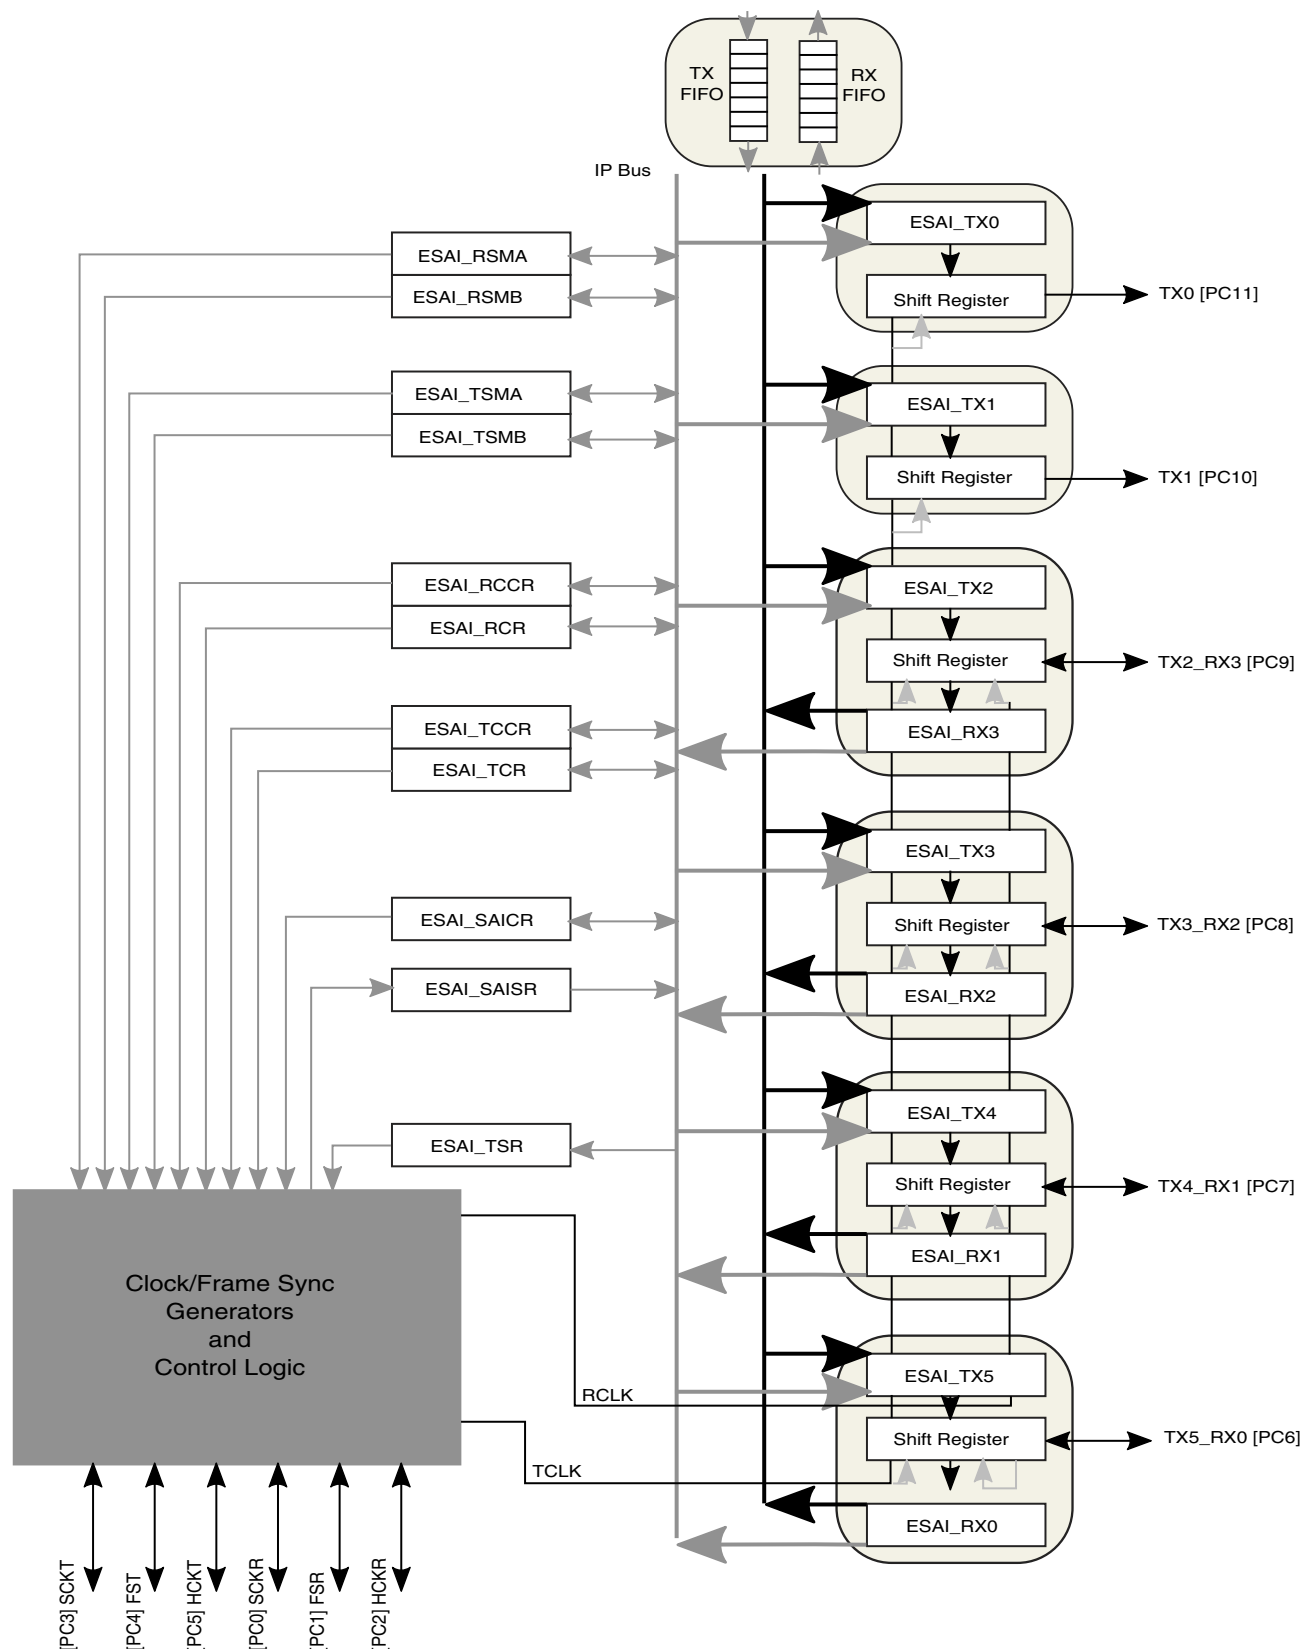

Figure 25-1. ESAI Block Diagram

25.1.1 Features

- Independent (asynchronous mode) or shared (synchronous mode) transmit and receive sections with separate or shared internal/external clocks and frame syncs, operating in Master or Slave mode.
- Up to six transmitters and four receivers with TX2_RX3, TX3_RX2, TX4_RX1, and TX5_RX0 pins shared by transmitters 2 to 5 and receivers 0 to 3. TX0 AND TX1 pins are used by transmitters 0 and 1 only.
- Programmable data interface modes such as I2S, LSB aligned, MSB aligned
- Programmable word length (8, 12, 16, 20 or 24bits)
- Flexible selection between system clock or external oscillator as input clock source, programmable internal clock divider and frame sync generation
- AC97 support
- Time Slot Mask Registers for reduced ARM platform overhead (for both Transmit and Receive)
- 128-word Transmit FIFO shared by six transmitters
- 128-word Receive FIFO shared by four receivers

25.1.2 Modes of Operation

ESAI has three basic operating modes and many data/operation formats.

ESAI operating mode are selected by the ESAI control registers (ESAI_TCCR, ESAI_TCR, ESAI_RCCR, ESAI_RCR, and ESAI_SAICR). The main operating modes are described in the following section.

25.1.2.1 Normal/Network/On-Demand Mode Selection

Selecting between the normal mode and network mode is accomplished by clearing or setting the TMOD0-TMOD1 bits in the ESAI_TCR register for the transmitter section, as well as in the RMOD0-RMOD1 bits in the ESAI_RCR register for the receiver section.

For normal mode, the ESAI functions with one data word of I/O per frame (per enabled transmitter or receiver). The normal mode is typically used to transfer data to or from a single device.

For the network mode, 2 to 32 time slots per frame may be selected. During each frame, 0 to 32 data words of I/O may be received or transmitted. In either case, the transfers are periodic. The frame sync signal indicates the first time slot in the frame. Network mode is typically used in time division multiplexed (TDM) networks of codecs, DSPs with multiple words per frame, or multi-channel devices.

Selecting the network mode and setting the frame rate divider to zero (DC=00000) selects the on-demand mode. This special case does not generate a periodic frame sync. A frame sync pulse is generated only when data is available to transmit. The on-demand mode requires that the transmit frame sync be internal (output) and the receive frame sync be external (input). Therefore, for simplex operation, the synchronous mode could be used; however, for full-duplex operation, the asynchronous mode must be used. Data transmission that is data driven is enabled by writing data into each TX. Although the ESAI is double buffered, only one word can be written to each TX, even if the transmit shift register is empty. The receive and transmit interrupts function as usual using TDE and RDF; however, transmit underruns are impossible for on-demand transmission and are disabled.

25.1.2.2 Synchronous/Asynchronous Operating Modes

The transmit and receive sections of the ESAI may be synchronous or asynchronous, that is, the transmitter and receiver sections may use common clock and synchronization signals (synchronous operating mode), or they may have their own separate clock and sync signals (asynchronous operating mode).

The SYN bit in the ESAI_SAICR register selects synchronous or asynchronous operation. Because the ESAI is designed to operate either synchronously or asynchronously, separate receive and transmit interrupts are provided.

When SYN is cleared, the ESAI transmitter and receiver clocks and frame sync sources are independent. If SYN is set, the ESAI transmitter and receiver clocks and frame sync come from the transmitter section (either external or internal sources).

Data clock and frame sync signals can be generated internally by the ARM Core or may be obtained from external sources. If internally generated, the ESAI clock generator is used to derive high frequency clock, bit clock and frame sync signals from the ARM Core internal system clock.

25.1.2.3 Frame Sync Selection

The frame sync can be either a bit-long or word-long signal.

The transmitter frame format is defined by the TFSL bit in the ESAI_TCR register. The receiver frame format is defined by the RFSL bit in the ESAI_RCR register.

1. In the word-long frame sync format, the frame sync signal is asserted during the entire word data transfer period. This frame sync length is compatible with codecs, SPI serial peripherals, serial A/D and D/A converters, shift registers and telecommunication PCM serial I/O.
2. In the bit-long frame sync format, the frame sync signal is asserted for one bit clock immediately before the data transfer period. This frame sync length is compatible with Intel and National components, codecs and telecommunication PCM serial I/O.

The relative timing of the word length frame sync as referred to the data word is specified by the TFSR bit in the ESAI_TCR register for the transmitter section and by the RFSR bit in the ESAI_RCR register for the receive section. The word length frame sync may be generated (or expected) with the first bit of the data word, or with the last bit of the previous word. TFSR and RFSR are ignored when a bit length frame sync is selected.

Polarity of the frame sync signal may be defined as positive (asserted high) or negative (asserted low). The TFSP bit in the ESAI_TCCR register specifies the polarity of the frame sync for the transmitter section. The RFSP bit in the ESAI_RCCR register specifies the polarity of the frame sync for the receiver section.

The ESAI receiver looks for a receive frame sync leading edge (trailing edge if RFSP is set) only when the previous frame is completed. If the frame sync goes high before the frame is completed (or before the last bit of the frame is received in the case of a bit frame sync or a word length frame sync with RFSR set), the current frame sync is not recognized, and the receiver is internally disabled until the next frame sync. Frames do not have to be adjacent, that is, a new frame sync does not have to immediately follow the previous frame. Gaps of arbitrary periods can occur between frames. Enabled transmitters are tri-stated during these gaps.

When operating in the synchronous mode (SYN=1), all clocks including the frame sync are generated by the transmitter section.

25.1.2.4 Shift Direction Selection

Some data formats, such as those used by codecs, specify MSB first while other data formats, such as the AES-EBU digital audio interface, specify LSB first.

The MSB/LSB first selection is made by programming RSHFD bit in the ESAI_RCR register for the receiver section and by programming the TSHFD bit in the ESAI_TCR register for the transmitter section.

25.2 External Signals

Three to twelve pins are required for operation, depending on the operating mode selected and the number of transmitters and receivers enabled.

The TX0 and TX1 pins are used by transmitters 0 and 1 only. The TX2_RX3, TX3_RX2, TX4_RX1, and TX5_RX0 pins are shared by transmitters 2 to 5 with receivers 0 to 3. The actual mode of operation is selected under software control. All transmitters operate fully synchronized under control of the same transmitter clock signals. All receivers operate fully synchronized under control of the same receiver clock signals.

The following table describes the external signals of ESAI:

Table 25-1. ESAI External Signals

| Signal | Description | Pad | Mode | Direction |
|----------------|--|--------------|------|-----------|
| ESAI_RX_CLK | RX serial bit clock for the ESAI interface. The direction can be programmed. | ENET_MDIO | ALT2 | IO |
| | | GPIO_1 | ALT0 | |
| ESAI_RX_FS | RX frame sync signal for the ESAI interface. | ENET_REF_CLK | ALT2 | IO |
| | | GPIO_9 | ALT0 | |
| ESAI_RX_HF_CLK | RX high frequency clock for the ESAI interface. | ENET_RX_ER | ALT2 | IO |
| | | GPIO_3 | ALT0 | |
| ESAI_TX0 | Used for transmitting data from the ESAI_TX0 serial transmit shift register. | GPIO_17 | ALT0 | IO |
| | | NANDF_CS2 | ALT2 | |
| ESAI_TX1 | Used for transmitting data from the ESAI_TX1 serial transmit shift register. | GPIO_18 | ALT0 | IO |
| | | NANDF_CS3 | ALT2 | |
| ESAI_TX2_RX3 | Used as TX2 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin | ENET_TXD1 | ALT2 | IO |
| | Used as the RX3 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin | GPIO_5 | ALT0 | |
| ESAI_TX3_RX2 | Used as TX3 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin | ENET_TX_EN | ALT2 | IO |
| | Used as the RX2 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin | GPIO_16 | ALT0 | |

Table continues on the next page...

**Table 25-1. ESAI External Signals
(continued)**

| Signal | Description | Pad | Mode | Direction |
|----------------|---|------------|------|-----------|
| ESAI_TX4_RX1 | Used as TX4 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin Used as the RX1 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin | ENET_TXD0 | ALT2 | IO |
| | | GPIO_7 | ALT0 | |
| ESAI_TX5_RX0 | Used as TX5 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin Used as the RX0 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin | ENET_MDC | ALT2 | IO |
| | | GPIO_8 | ALT0 | |
| ESAI_TX_CLK | TX serial bit clock for the ESAI interface. The direction can be programmed. | ENET_CRSDV | ALT2 | IO |
| | | GPIO_6 | ALT0 | |
| ESAI_TX_FS | Frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode | ENET_RXD1 | ALT2 | IO |
| | | GPIO_2 | ALT0 | |
| ESAI_TX_HF_CLK | TX high frequency clock for the ESAI interface. | ENET_RXD0 | ALT2 | IO |
| | | GPIO_4 | ALT0 | |

25.2.1 Serial Transmit 0 Data Pin

TX0 is used for transmitting data from the ESAI_TX0 serial transmit shift register.

TX0 is an output when data is being transmitted from the ESAI_TX0 shift register. In the on-demand mode with an internally generated bit clock, the TX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX0 may be programmed as a disconnected pin (PC11) when the ESAI TX0 function is not being used. (See [Table 25-48](#).)

25.2.2 Serial Transmit 1 Data Pin

TX1 is used for transmitting data from the ESAI_TX1 serial transmit shift register.

TX1 is an output when data is being transmitted from the ESAI_TX1 shift register. In the on-demand mode with an internally generated bit clock, the TX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX1 may be programmed as a disconnected pin (PC10) when the ESAI TX1 function is not being used. (See [Table 25-48](#).)

25.2.3 Serial Transmit 2/Receive 3 Data Pin

TX2_RX3 is used as the TX2 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin, or as the RX3 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin.

TX2_RX3 is an input when data is being received by the ESAI_RX3 shift register.

TX2_RX3 is an output when data is being transmitted from the ESAI_TX2 shift register. In the on-demand mode with an internally generated bit clock, the TX2_RX3 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX2_RX3 may be programmed as a disconnected pin (PC9) when the ESAI TX2 and RX3 functions are not being used. (See [Table 25-48](#).)

25.2.4 Serial Transmit 3/Receive 2 Data Pin

TX3_RX2 is used as the TX3 signal for transmitting data from the ESAI_TX3 serial transmit shift register when programmed as a transmitter pin, or as the RX2 signal for receiving serial data to the ESAI_RX2 serial receive shift register when programmed as a receiver pin.

TX3_RX2 is an input when data is being received by the ESAI_RX2 shift register.

TX3_RX2 is an output when data is being transmitted from the ESAI_TX3 shift register. In the on-demand mode with an internally generated bit clock, the TX3_RX2 pin

becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX3_RX2 may be programmed as a disconnected pin (PC8) when the ESAI TX3 and RX2 functions are not being used. (See [Table 25-48](#).)

25.2.5 Serial Transmit 4/Receive 1 Data Pin

TX4_RX1 is used as the TX4 signal for transmitting data from the ESAI_TX4 serial transmit shift register when programmed as transmitter pin, or as the RX1 signal for receiving serial data to the RX1 serial receive shift register when programmed as a receiver pin.

TX4_RX1 is an input when data is being received by the ESAI_RX1 shift register. TX4_RX1 is an output when data is being transmitted from the ESAI_TX4 shift register. In the on-demand mode with an internally generated bit clock, the TX4_RX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX4_RX1 may be programmed as a disconnected pin (PC7) when the ESAI TX4 and RX1 functions are not being used. (See [Table 25-48](#).)

25.2.6 Serial Transmit 5/Receive 0 Data Pin

TX5_RX0 is used as the TX5 signal for transmitting data from the ESAI_TX5 serial transmit shift register when programmed as transmitter pin, or as the RX0 signal for receiving serial data to the ESAI_RX0 serial shift register when programmed as a receiver pin.

TX5_RX0 is an input when data is being received by the ESAI_RX0 shift register. TX5_RX0 is an output when data is being transmitted from the ESAI_TX5 shift register. In the on-demand mode with an internally generated bit clock, the TX5_RX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX5_RX0 may be programmed as a disconnected pin (PC6) when the ESAI TX5 and RX0 functions are not being used. (See [Table 25-48](#).)

25.2.7 Receiver Serial Clock

SCKR is a bidirectional pin providing the receivers serial bit clock for the ESAI interface.

The direction of this pin is determined by the RCKD bit in the ESAI_RCCR register. The SCKR operates as a clock input or output used by all the enabled receivers in the asynchronous mode (SYN=0), or as serial flag 0 pin in the synchronous mode (SYN=1).

When this pin is configured as serial flag pin, its direction is determined by the RCKD bit in the ESAI_RCCR register. When configured as the output flag OF0, this pin reflects the value of the OF0 bit in the ESAI_SAICR register, and the data in the OF0 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When this pin is configured as the input flag IF0, the data value at the pin is stored in the IF0 bit in the ESAI_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

SCKR may be programmed as a disconnected pin (PC0) when the ESAI SCKR function is not being used. (See [Table 25-48](#).)

NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal 133 MHz ESAI system clock, the external ESAI serial clock frequency cannot exceed $133\text{MHz}/4 = 33.25\text{ MHz}$ and each external ESAI serial clock phase must exceed the minimum of $2 \times 1/133\text{MHz} = 15.04\text{ns}$.

For SCKR pin mode definitions, see [Table 25-39](#).

The table below provides a list of asynchronous-mode receiver clock sources. For more information about EXTAL/ESAI clocking control bits (ERI, ERO), refer to [ESAI Control Register \(ESAI_ECR\)](#).

Table 25-2. Receiver Clock Sources (Asynchronous Mode Only)

| RHCKD | RFSD | RCKD | ERI | ERO | Receiver Bit Clock Source | OUTPUTS | | |
|-------|------|------|-----|-----|---------------------------|---------|-----|------|
| 0 | 0 | 0 | N/A | N/A | SCKR | - | - | - |

| 1 | 1 | 1 | 1 | 1 | EXTAL | HCKR | FSR | SCKR |

Fsys = 133MHz.
EXTAL is the on-chip clock source other than ESAI system 133MHz clock, and it is from esai_clk_root in CCM

25.2.8 Transmitter Serial Clock

SCKT is a bidirectional pin providing the transmitters serial bit clock for the ESAI interface.

The direction of this pin is determined by the TCKD bit in the ESAI_TCCR register. The SCKT is a clock input or output used by all the enabled transmitters in the asynchronous mode (SYN=0) or by all the enabled transmitters and receivers in the synchronous mode (SYN=1).

The following table provides a list of asynchronous-mode transmitter clock sources.

Table 25-3. Transmitter Clock Sources (Asynchronous Mode Only)

| THCKD | TFSD | TCKD | ETI | ETO | Transmitter Bit Clock Source | OUTPUTS | | |
|-------|------|------|-----|-----|------------------------------|---------|-----|------|

| 1 | 1 | 1 | 1 | 1 | EXTAL | HCKT | FST | SCKT |

Fsys = 133MHz.
EXTAL is the on-chip clock sources other than ESAI system 133MHz clock, and it is from esai_clk_root in CCM

SCKT may be programmed as a disconnected pin (PC3) when the ESAI SCKT function is not being used. (See [Table 25-48](#).)

For more information about EXTAL/ESAI clocking control bits (ETI, ETO), see [ESAI Control Register \(ESAI_ECR\)](#).

NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal 133 MHz ESAI system clock, the external ESAI serial clock frequency cannot exceed $133\text{MHz}/4 = 33.25\text{ MHz}$ and each external ESAI serial clock phase must exceed the minimum of $2 \times 1/133\text{MHz} = 15.04\text{ns}$.

25.2.9 Frame Sync for Receiver

FSR is a bidirectional pin providing the receivers frame sync signal for the ESAI interface. The direction of this pin is determined by the RFSD bit in ESAI_RCR register.

In the asynchronous mode (SYN=0), the FSR pin operates as the frame sync input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as either the serial flag 1 pin (TEBE=0), or as the transmitter external buffer enable control (TEBE=1, RFSD=1). For FSR pin mode definitions, see [Table 25-40](#); for receiver clock signals, see [Table 25-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RFSD bit in the ESAI_RCCR register. When configured as the output flag OF1, this pin reflects the value of the OF1 bit in the ESAI_SAICR register, and the data in the OF1 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF1, the data value at the pin is stored in the IF1 bit in the ESAI_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

FSR may be programmed as a disconnected pin (PC1) when the ESAI FSR function is not being used. (See [Table 25-48](#).)

25.2.10 Frame Sync for Transmitter

FST is a bidirectional pin providing the frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode (SYN=0) (see [Table 25-3](#)). The direction of this pin is determined by the TFSD bit in the ESAI_TCR register. When configured as an output, this pin is the internally generated frame sync signal. When configured as an input, this pin receives an external frame sync signal for the transmitters (and the receivers in synchronous mode).

FST may be programmed as a disconnected pin (PC4) when the ESAI FST function is not being used. (See [Table 25-48](#).)

25.2.11 High Frequency Clock for Transmitter

HCKT is a bidirectional pin providing the transmitters high frequency clock for the ESAI interface.

The direction of this pin is determined by the THCKD bit in the ESAI_TCCR register. In the asynchronous mode (SYN=0), the HCKT pin operates as the high frequency clock input or output used by all enabled transmitters. In the synchronous mode (SYN=1), it operates as the high frequency clock input or output used by all enabled transmitters and receivers. When programmed as input this pin is used as an alternative high frequency

clock source to the ESAI transmitter rather than the ARM Core main clock. When programmed as output it can serve as a high frequency sample clock (to external DACs for example) or as an additional system clock (see [Table 25-3](#)).

HCKT may be programmed as a disconnected pin (PC5) when the ESAI HCKT function is not being used. (See [Table 25-48](#).)

25.2.12 High Frequency Clock for Receiver

HCKR is a bidirectional pin providing the receivers high frequency clock for the ESAI interface.

The direction of this pin is determined by the RHCKD bit in the ESAI_RCCR register. In the asynchronous mode (SYN=0), the HCKR pin operates as the high frequency clock input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as the serial flag 2 pin. For HCKR pin mode definitions, see [Table 25-41](#); for receiver clock signals, see [Table 25-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RHCKD bit in the ESAI_RCCR register. When configured as the output flag OF2, this pin reflects the value of the OF2 bit in the ESAI_SAICR register, and the data in the OF2 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF2, the data value at the pin is stored in the IF2 bit in the ESAI_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

HCKR may be programmed as a disconnected pin (PC2) when the ESAI HCKR function is not being used. (See [Table 25-48](#).)

25.2.13 Serial I/O Flags

Three ESAI pins (FSR, SCKR and HCKR) are available as serial I/O flags when the ESAI is operating in the synchronous mode (SYN=1).

Their operation is controlled by RCKD, RFSD, TEBE bits in the ESAI_RCR, ESAI_RCCR and ESAI_SAICR registers. The output data bits (OF2, OF1 and OF0) and the input data bits (IF2, IF1 and IF0) are double buffered to/from the HCKR, FSR and SCKR pins. Double buffering the flags keeps them in sync with the TX and RX data lines.

Each flag can be separately programmed. Flag 0 (SCKR pin) direction is selected by RCKD, RCKD=1 for output and RCKD=0 for input. Flag 1 (FSR pin) is enabled when the pin is not configured as external transmitter buffer enable (TEBE=0) and its direction is selected by RFSD, RFSD=1 for output and RFSD=0 for input. Flag 2 (HCKR pin) direction is selected by RHCKD, RHCKD=1 for output and RHCKD=0 for input.

When programmed as input flags, the SCKR, FSR and HCKR logic values, respectively, are latched at the same time as the first bit of the receive data word is sampled. Because the input was latched, the signal on the input flag pin (SCKR, FSR or HCKR) can change without affecting the input flag until the first bit of the next receive data word. When the received data words are transferred to the receive data registers, the input flag latched values are then transferred to the IF0, IF1 and IF2 bits in the SAISR register, where they may be read by software.

When programmed as output flags, the SCKR, FSR and HCKR logic values are driven by the contents of the OF0, OF1 and OF2 bits in the ESAI_SAICR register respectively, and they are driven when the transmit data registers are transferred to the transmit shift registers. The value on SCKR, FSR and HCKR is stable from the time the first bit of the transmit data word is transmitted until the first bit of the next transmit data word is transmitted. Software may change the OF0-OF2 values thus controlling the SCKR, FSR and HCKR pin values for each transmitted word. The normal sequence for setting output flags when transmitting data is as follows: wait for TDE (transmitter empty) to be set; first write the flags, and then write the transmit data to the transmit registers. OF0, OF1, and OF2 are double buffered so that the flag states appear on the pins when the transmit data is transferred to the transmit shift register, that is, the flags are synchronous with the data.

25.3 Clocks

The table found here describes the clock sources for ESAI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 25-4. ESAI Clocks

| Clock name | Clock Root | Description |
|--------------|---------------|-------------------------|
| extal_clk | esai_clk_root | ESAI system clock |
| ipg_clk_esai | ahb_clk_root | Bus clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |
| mem_clk | ahb_clk_root | Mem clock |

25.4 Functional Description

This section provides a complete functional description of the block.

25.4.1 ESAI After Reset

Hardware or software reset clears the port control register bits and the port direction control register bits, which configure all ESAI I/O pins as disconnected and both ESAI FIFOs are also in reset state.

The ESAI is in personal reset state while all ESAI pins are programmed as disconnected, and it is active only if at least one of the ESAI I/O pins is programmed as an ESAI pin.

25.4.2 ESAI Interrupt Requests

The ESAI can generate eight different interrupt requests

(ordered from the highest to the lowest priority):

1. ESAI Receive Data with Exception Status

Occurs when the receive exception interrupt is enabled (REIE=1 in the RCR register), at least one of the enabled receive data registers is full (RDF=1) and a receiver overrun error has occurred (ROE=1 in the SAISR register). ROE is cleared by first reading the SAISR and then reading all the enabled receive data registers.

2. ESAI Receive Even Data

Occurs when the receive even slot data interrupt is enabled (REDIE=1), at least one of the enabled receive data registers is full (RDF=1), the data is from an even slot (REDF=1) and no exception has occurred (ROE=0 or REIE=0).

Reading all enabled receiver data registers clears RDF and REDF.

3. ESAI Receive Data

Occurs when the receive interrupt is enabled (RIE=1), at least one of the enabled receive data registers is full (RDF=1), no exception has occurred (ROE=0 or REIE=0) and no even slot interrupt has occurred (REDF=0 or REDIE=0). Reading all enabled receiver data registers clears RDF.

4. ESAI Receive Last Slot Interrupt

Occurs, if enabled (RLIE=1), after the last slot of the frame ended (in network mode only) regardless of the receive mask register setting. The receive last slot interrupt may be used for resetting the receive mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the receive last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum receive last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

5. ESAI Transmit Data with Exception Status

Occurs when the transmit exception interrupt is enabled (TEIE=1), at least one transmit data register of the enabled transmitters is empty (TDE=1) and a transmitter underrun error has occurred (TUE=1). TUE is cleared by first reading the SAISR and then writing to all the enabled transmit data registers, or to the TSR register.

6. ESAI Transmit Last Slot Interrupt

Occurs, if enabled (TLIE=1), at the start of the last slot of the frame in network mode regardless of the transmit mask register setting. The transmit last slot interrupt may be used for resetting the transmit mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the transmit last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum transmit last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

7. ESAI Transmit Even Data

Occurs when the transmit even slot data interrupt is enabled (TEDIE=1), at least one of the enabled transmit data registers is empty (TDE=1), the slot is an even slot (TEDE=1) and no exception has occurred (TUE=0 or TEIE=0). Writing to all the TX registers of the enabled transmitters or to TSR clears this interrupt request.

8. ESAI Transmit Data

Occurs when the transmit interrupt is enabled (TIE=1), at least one of the enabled transmit data registers is empty (TDE=1), no exception has occurred (TUE=0 or TEIE=0) and no even slot interrupt has occurred (TEDE=0 or TEDIE=0). Writing to all the TX registers of the enabled transmitters, or to the TSR clears this interrupt request.

25.4.3 ESAI DMA Requests from the FIFOs

The ESAI can generate two different DMA requests:

1. ESAI Transmit FIFO Empty - Asserts when the number of empty slots in the ESAI transmit FIFO exceeds the threshold programmed in the ESAI Transmit FIFO Configuration Register (TFCR). Automatically negates when the number of empty slots is less than the threshold programmed in the ESAI Transmit FIFO Configuration Register.
2. ESAI Receive FIFO Full - Asserts when the number of data words in the ESAI receive FIFO exceeds the threshold programmed in the ESAI Receive FIFO Configuration Register (RFCR). Automatically negates when the number of words is less than the threshold programmed in the ESAI Receive FIFO Configuration Register.

25.4.4 ESAI Transmit and Receive Shift Registers

25.4.4.1 ESAI Transmit Shift Registers

The transmit shift registers contain the data being transmitted

([Figure 25-2](#) and [Figure 25-3](#)).

Data is shifted out to the serial transmit data pins by the selected (internal/external) bit clock when the associated frame sync I/O is asserted.

The number of bits shifted out before the shift registers are considered empty and may be written to again can be 8, 12, 16, 20, 24 or 32 bits (determined by the slot length control bits in the TCR register). Data is shifted out of these registers MSB first if TSHFD=0 and LSB first if TSHFD=1.

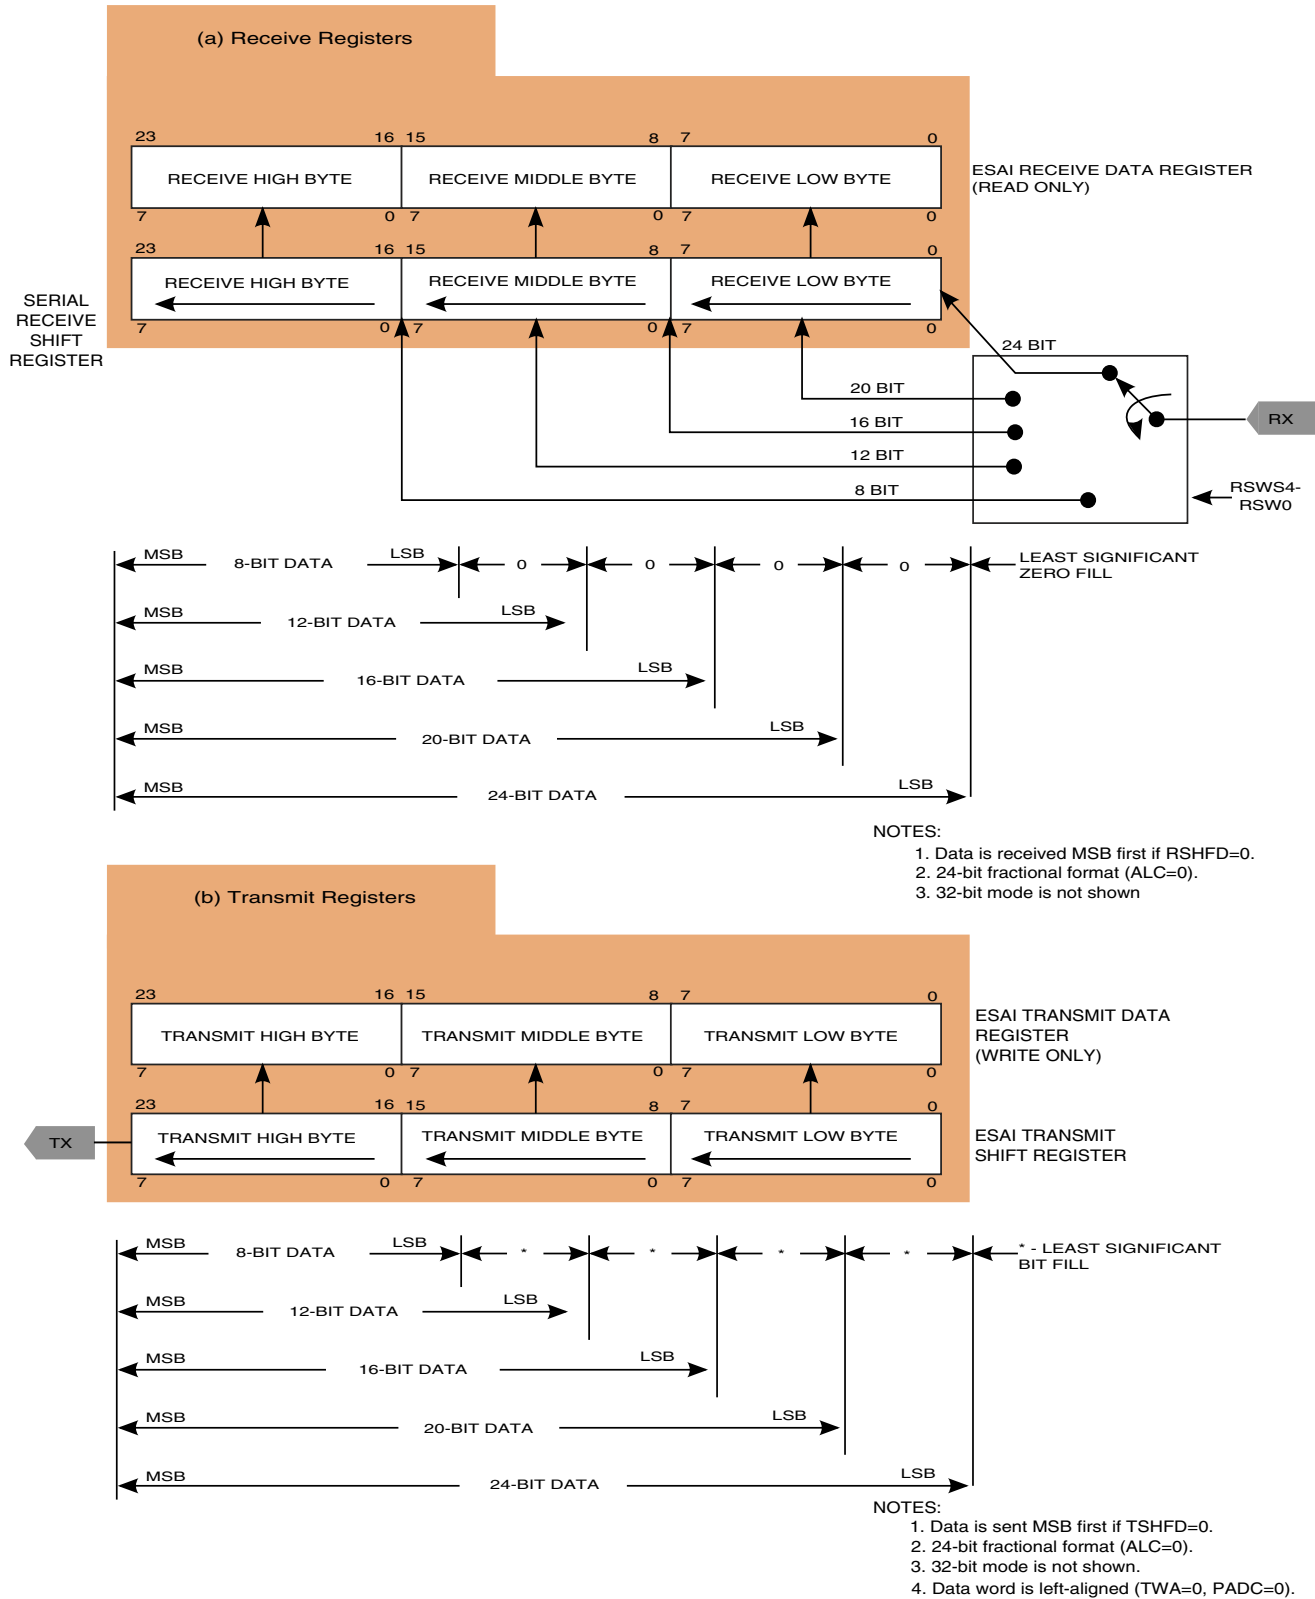

Figure 25-2. ESAI Data Path Programming Model ([R/T]SHFD=0)

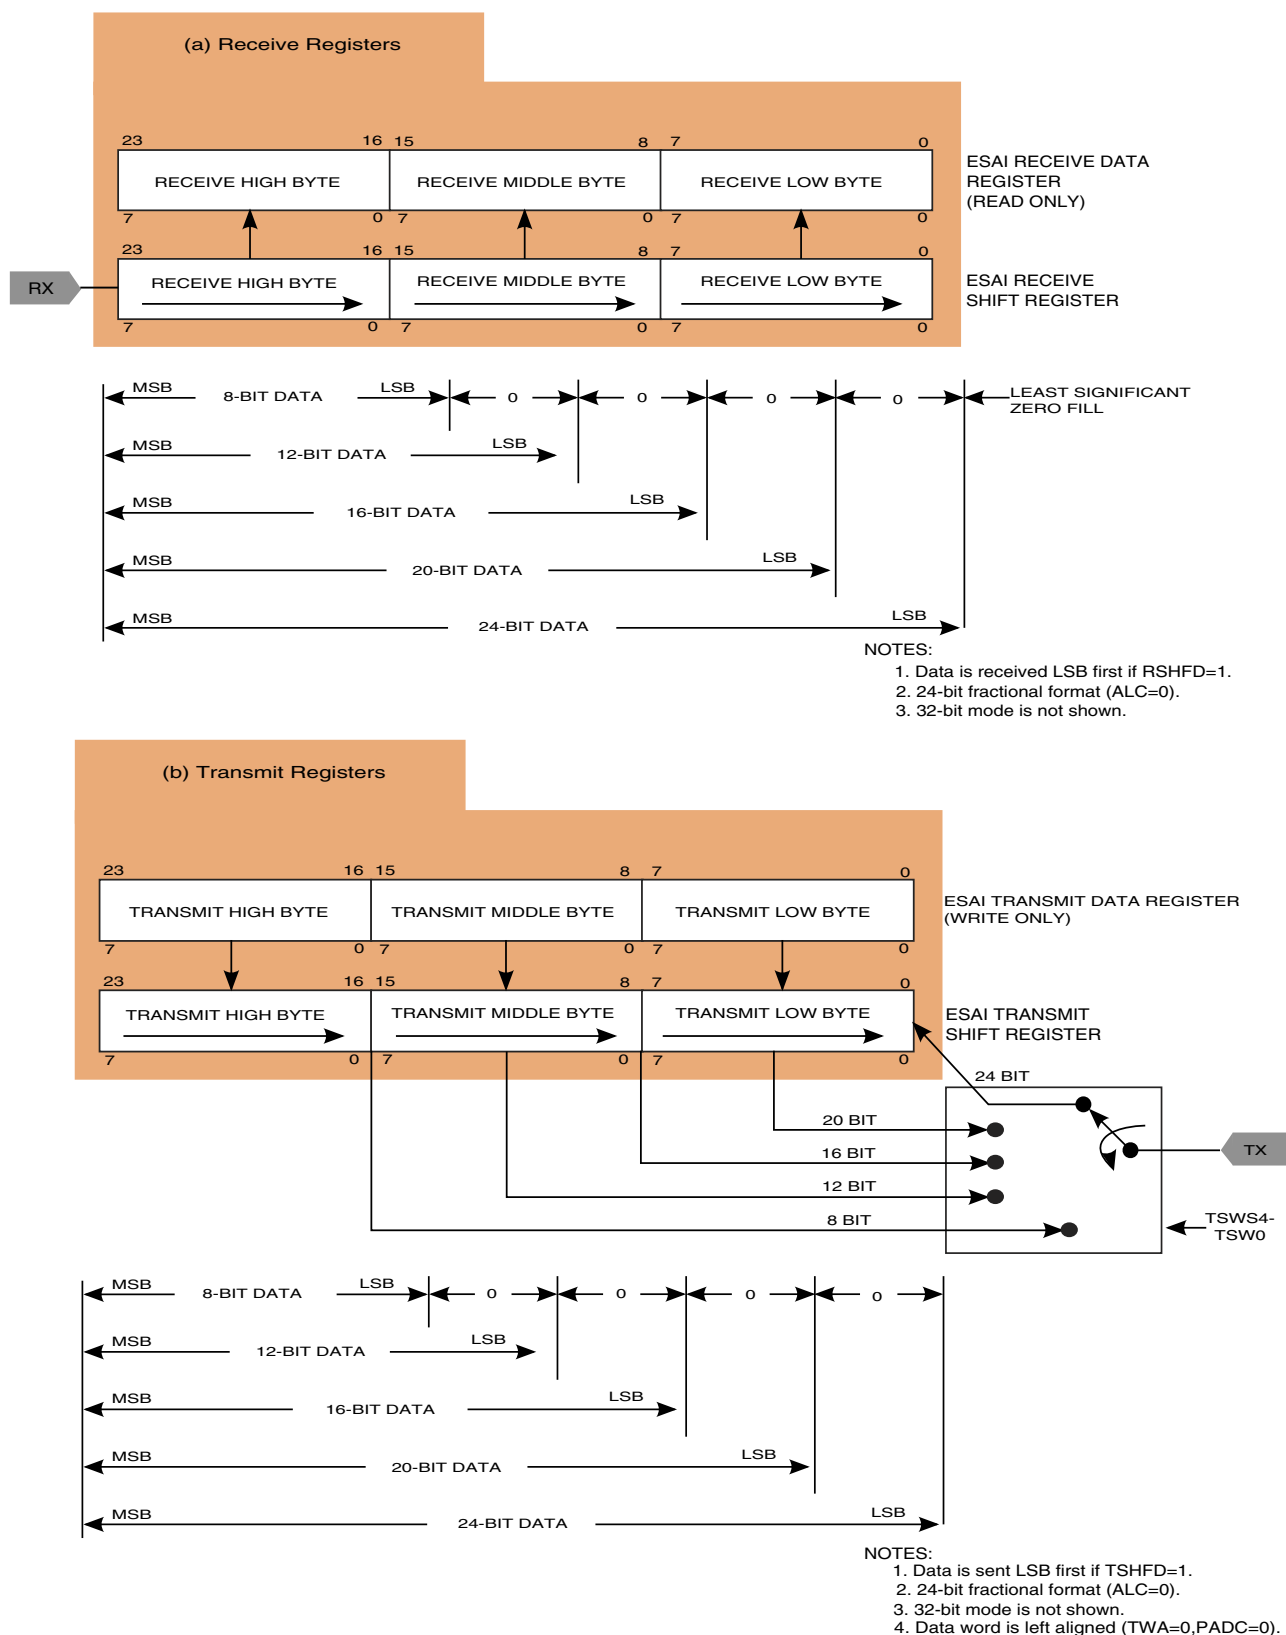

Figure 25-3. ESai Data Path Programming Model ([R/T]SHFD=1)

25.4.4.2 ESAI Receive Shift Registers

The receive shift registers (Figure 25-2 and Figure 25-3) receive the incoming data from the serial receive data pins. Data is shifted in by the selected (internal/external) bit clock when the associated frame sync I/O is asserted. Data is assumed to be received MSB first if RSHFD=0 and LSB first if RSHFD=1. Data is transferred to the ESAI receive data registers after 8, 12, 16, 20, 24, or 32 serial clock cycles were counted, depending on the slot length control bits in the ESAI_RCR register.

25.5 Initialization Information

25.5.1 ESAI Initialization

The correct way to initialize the ESAI is as follows:

1. Enable the ESAI logic clock by asserting bit 0 of ESAI Control Register (ESAI_ECR[0]).
2. Hardware, software, ESAI individual reset. Note that asserting bit 1 of ESAI Control Register only reset the ESAI core logic, including configuration registers, but not the ESAI FIFOs.
3. Reset ESAI FIFOs by asserting bit 1 of ESAI_TFCR and ESAI_RFCR.
4. Program ESAI control and time slot registers. (The transmit/receive enable bits of TCR/RCR should not be set.)
5. Program ESAI FIFOs via TFCR and RFCR. (Enable Transmit/Receive FIFO, enable transmitters/receivers, transmit initialization and set Transmit FIFO/Receive FIFO watermark.)
6. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR
7. Remove ESAI personal reset by configuring ESAI_PCRC and ESAI_PRRC.
8. Enabled Transmitters/Receivers in ESAI_TCR/ESAI_RCR.

During program execution, all ESAI pins may be defined disconnected, causing the ESAI to stop serial activity and enter the individual reset state.

All status bits of the interface are set to their reset state however, the control bits are not affected. This procedure allows the programmer to reset the ESAI separately from the other internal peripherals. During individual reset, internal DMA accesses to the data registers of the ESAI are not valid and data read is undefined.

The programmer must use an individual ESAI reset when changing the ESAI control registers (except for TEIE, REIE, TLIE, RLIE, TIE, RIE, TE0-TE5, RE0-RE3) to ensure proper operation of the interface.

NOTE

If the ESAI receiver section is already operating with some of the receivers and enabling additional receivers on the fly, that is, without first putting the ESAI receiver in the personal reset state by setting their REx control bits, it will result in erroneous data being received as the first data word for the newly enabled receivers.

25.5.2 ESAI Initialization Examples

25.5.2.1 Initializing the ESAI using Personal Reset

1. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI_ECR[0]).
2. The ESAI should be in its personal reset state (ESAI_PCRC = 0x000 and ESAI_PRRC = 0x000). In the personal reset state, both the transmitter and receiver sections of the ESAI are simultaneously reset. The TPR bit in the ESAI_TCR register may be used to reset just the transmitter section. The RPR bit in the ESAI_RCR register may be used to reset just the receiver section.
3. Configure the control registers (ESAI_TCCR, ESAI_TCR, ESAI_RCCR, ESAI_RCR) and ESAI FIFOs configuration Registers (ESAI_TFCR, ESAI_RFCR) according to the operating mode, but do not enable transmitters (TE5-TE0 = 0x0) or receivers (RE3-RE0 = 0x0). It is possible to set the interrupt enable bits which are in use during the operation (no interrupt occurs).
4. Enable the ESAI by setting the ESAI_PCRC and ESAI_PRRC register bits according to pins which are in use during operation.
5. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR. This step is needed even if DMA is used to service the transmitters.
6. Enable the transmitters and receivers.
7. From now on ESAI can be serviced either by polling, interrupts, or DMA.

Operation proceeds as follows:

- For internally generated clock and frame sync, these signals are active immediately after ESAI is enabled (step 4 above).

- Data is received only when one of the receive enable (REx) bits is set and after the occurrence of frame sync signal (either internally or externally generated).
- Data is transmitted only when the transmitter enable (TE_x) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE_x bit is set until the frame sync occurs.

25.5.2.2 Initializing the ESAI Transmitter Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI_ECR[0])
3. The transmitter section should be in its individual reset state (TPR = 1) and also reset the ESAI Transmit FIFO (ESAI_TFCR[1] = 1).
4. Configure the control registers ESAI_TCCR and ESAI_TCR according to the operating mode, configure the Transmit FIFO Configuration Register (bring transmit FIFO out of reset, enable Transmit FIFO, enable transmitters, transmit initialization and set watermark). Make sure to clear the transmitter enable bits (TE0-TE5). TPR must remain set.
5. Take the transmitter section out of the individual reset state by clearing TPR.
6. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR
7. Enable the transmitters by setting their TE bits.
8. Data is transmitted only when the transmitter enable (TE_x) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE_x bit is set until the frame sync occurs.
9. From now on the transmitters are operating and can be serviced either by polling, interrupts, or DMA.

25.5.2.3 Initializing the ESAI Receiver Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register (ESAI_ECR[0])
3. The receiver section should be in its individual reset state (RPR = 1) and also reset the ESAI Receive FIFO (ESAI_RFCR[1] = 1).
4. Configure the control registers ESAI_RCCR and ESAI_RCR according to the operating mode, configure the Receive FIFO Configuration Register (bring receive

FIFO out of reset, enable Receive FIFO, receivers, and set watermark). Making sure to clear the receiver enable bits (RE0-RE3). RPR must remain set.

5. Take the receiver section out of the individual reset state by clearing RPR.
6. Enable the receivers by setting their RE bits.
7. From now on the receivers are operating and can be serviced either by polling, interrupts, or DMA.

25.6 ESAI Memory Map/Register Definition

ESAI memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|-----------------------|-------------|------------------------------|
| 202_4000 | ESAI Transmit Data Register (ESAI_ETDR) | 32 | W (always reads 0) | 0000_0000h | 25.6.1/1223 |

ESAI_ETDR field descriptions

| Field | Description |
|--------------|--|
| 31–0 ETDR | ESAI Transmit Data Register. Writing to this register stores the data written into the ESAI Transmit FIFO. Writing to this register when the Transmit FIFO is full causes the data written to be lost (the existing data within the FIFO is not overwritten). When multiple ESAI transmitters are enabled, the data for each transmitter must be interleaved from lowest transmitter to highest transmitter (for example, if transmitters 0, 2 and 3 are enabled then data must be written as follows: transmitter #0, transmitter #2, transmitter #3, transmitter #0, transmitter #2, transmitter #3, transmitter #0, etc). Data within the ESAI Transmit FIFO is passed to the ESAI transmit shifter registers as defined by the Transmit Word Alignment configuration bits. |

25.6.2 ESAI Receive Data Register (ESAI_ERDR)

Address: 202_4000h base + 4h offset = 202_4004h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | ERDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ESAI_ERDR field descriptions

| Field | Description |
|--------------|---|
| 31–0 ERDR | ESAI Receive Data Register. Reading this register returns the data within the ESAI Receive FIFO. Reading this register when the Receive FIFO is empty returns the last valid data word. When multiple ESAI receivers are enabled, the data for each receiver is interleaved from lowest receiver to highest receiver (for example, if receivers 0, 2 and 3 are enabled then data is returned as follows: receiver #0, receiver #2, receiver #3, receiver #0, receiver #2, receiver #3, receiver #0, etc). Data is passed from the ESAI receive shift registers to the ESAI Receive FIFO as defined by the Receiver Word Alignment configuration bits either zero or sign-extended based on the Receive Extension control bit. |

25.6.3 ESAI Control Register (ESAI_ECR)

Address: 202_4000h base + 8h offset = 202_4008h

| | | | | | | | | | | | | | | | | |

ESAI_ESR field descriptions

| Field | Description |
|-------------------|---|
| 31–11 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 10 TINIT | Transmit Initialization. Indicates that the Transmit FIFO is writing the first word for each enabled transmitter into the Transmit Data Registers. This bit sets when the Transmit FIFO is enabled (provided Transmit Initialization is enabled) and clears after the Transmit Data Registers have been initialized. The Transmit Enable bits in the Transmit Control Register should not be set until this flag has cleared. 0 Transmitter has finished initializing the Transmit Data Registers (or Transmit FIFO is not enabled or Transmit Initialization is not enabled). 1 Transmitter has not finished initializing the Transmit Data Registers. |
| 9 RFF | Receive FIFO Full. Indicates that the number of data words in the Receive FIFO has equaled or exceeded the Receive FIFO Watermark. This flag also drives the ESAI Receiver DMA request line. ESAI FIFO DMA requests see ESAI DMA Requests from the FIFOs . 0 Number of words in Receive FIFO less than Receive FIFO watermark. 1 Number of words in Receive FIFO is equal to or greater than Receive FIFO watermark. |
| 8 TFE | Transmit FIFO Empty. Indicates that the number of empty slots in the Transmit FIFO has met or exceeded the Transmit FIFO Watermark. This flag also drives the ESAI Transmitter DMA request line. ESAI FIFO DMA request see ESAI DMA Requests from the FIFOs . 0 Number of empty slots in Transmit FIFO less than Transmit FIFO watermark. 1 Number of empty slots in Transmit FIFO is equal to or greater than Transmit FIFO watermark. |
| 7 TLS | Transmit Last Slot. Reading this register when TLS is set will negate the Transmit Last Slot interrupt. 0 TLS is not the highest priority active interrupt. 1 TLS is the highest priority active interrupt. |
| 6 TDE | Transmit Data Exception. 0 TDE is not the highest priority active interrupt. 1 TDE is the highest priority active interrupt. |
| 5 TED | Transmit Even Data. 0 TED is not the highest priority active interrupt. 1 TED is the highest priority active interrupt. |
| 4 TD | Transmit Data. 0 TD is not the highest priority active interrupt. 1 TD is the highest priority active interrupt. |
| 3 RLS | Receive Last Slot. Reading this register when RLS is set will negate the Receive Last Slot interrupt. 0 RLS is not the highest priority active interrupt. 1 RLS is the highest priority active interrupt. |
| 2 RDE | Receive Data Exception. 0 RDE is not the highest priority active interrupt. 1 RDE is the highest priority active interrupt. |
| 1 RED | Receive Even Data. 0 RED is not the highest priority active interrupt. 1 RED is the highest priority active interrupt. |

ESAI_TFCR field descriptions

| Field | Description |
|-------------------|--|
| 31–20 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 19 TIEN | Transmitter Initialization Enable. Enables the initialization of the Transmit Data Registers when the Transmitter FIFO is enabled. TIEN=1 is recommended. 0 Transmit Data Registers are not initialized from the FIFO once the Transmit FIFO is enabled. Software must manually initialize the Transmit Data Registers separately. 1 Transmit Data Registers are initialized from the FIFO once the Transmit FIFO is enabled. |
| 18–16 TWA[2:0] | Transmit Word Alignment. Configures the alignment of the data written into the ESAI Transmit Data Register and then passed to the relevant 24 bit Transmit shift register. 000 MSB of data is bit 31. Data bits 7-0 are ignored when passed to transmit shift register. 001 MSB of data is bit 27. Data bits 3-0 are ignored when passed to transmit shift register. 010 MSB of data is bit 23. 011 MSB of data is bit 19. Bottom 4 bits of transmit shift register are zeroed. 100 MSB of data is bit 15. Bottom 8 bits of transmit shift register are zeroed. 101 MSB of data is bit 11. Bottom 12 bits of transmit shift register are zeroed. 110 MSB of data is bit 7. Bottom 16 bits of transmit shift register are zeroed. 111 MSB of data is bit 3. Bottom 20 bits of transmit shift register are zeroed. |
| 15–8 TFWM[7:0] | Transmit FIFO Watermark. These bits configure the threshold at which the Transmit FIFO Empty flag will set. The TFE is set when the number of empty slots in the Transmit FIFO equal or exceed the selected threshold. |
| 7 TE5 | Transmitter #5 FIFO Enable. This bit enables transmitter #5 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. |

Table continues on the next page...

| Field | Description |
|-------------------|--|
| 11–10 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 9–8 NRFO[1:0] | Next Receiver FIFO Out. Indicates which receiver returns the top word of the Receive FIFO. 00 Receiver #0 returns next word from the Receive FIFO. 01 Receiver #1 returns next word from the Receive FIFO. 10 Receiver #2 returns next word from the Receive FIFO. 11 Receiver #3 returns next word from the Receive FIFO. |
| 7–0 RFCNT[7:0] | Receive FIFO Counter. These bits indicate the number of data words stored in the Receive FIFO. |

25.6.9 Transmit Data Register n (ESAI_TXn)

ESAI_TX5, ESAI_TX4, ESAI_TX3, ESAI_TX2, ESAI_TX1 and ESAI_TX0 are 32-bit write-only registers. Data to be transmitted is written into these registers and is automatically transferred to the transmit shift registers (Figure 25-2 and Figure 25-3). The data written (8, 12, 16, 20, or 24 bits) should occupy the most significant portion of the TXn according to the ALC control bit setting. The unused bits (least significant portion and the 8 most significant bits when ALC=1) of the TXn are don't care bits. The Core is interrupted whenever the TXn becomes empty if the transmit data register empty interrupt has been enabled.

Address: 202_4000h base + 80h offset + (4d × i), where i=0d to 5d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ESAI_TSR field descriptions

| Field | Description |
|-------------------|--|
| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23–0 TSR[23:0] | The write-only Transmit Slot Register (ESAI_TSR) is effectively a null data register that is used when the data is not to be transmitted in the available transmit time slot. The transmit data pins of all the enabled transmitters are in the high-impedance state for the respective time slot where TSR has been written. The Transmitter External Buffer Enable pin (FSR pin when SYN=1, TEBE=1, RFSD=1) disables the external buffers during the slot when the ESAI_TSR register has been written. |

25.6.11 Receive Data Register n (ESAI_RXn)

ESAI_RX3, ESAI_RX2, ESAI_RX1, and ESAI_RX0 are 32-bit read-only registers that accept data from the receive shift registers when they become full ([Figure 25-2](#) and [Figure 25-3](#)). The data occupies the most significant portion of the receive data registers, according to the ALC control bit setting. The unused bits (least significant portion and 8 most significant bits when ALC=1) read as zeros. The Core is interrupted whenever RXn becomes full if the associated interrupt is enabled.

Address: 202_4000h base + A0h offset + (4d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23–0 RXn[23:0] | Accept data from the receive shift registers when they become full See ESAI Receive Shift Registers |

25.6.12 Serial Audio Interface Status Register (ESAI_SAISR)

The Status Register (ESAI_SAISR) is a read-only status register used by the ARM Core to read the status and serial input flags of the ESAI.

Address: 202_4000h base + CCh offset = 202_40CCh

ESAI_SAISR field descriptions

| Field | Description |
|-------------------|--|
| 31–18 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 17 TODFE | ESAI_SAISR Transmit Odd-Data Register Empty. When set, TODFE indicates that the enabled transmitter data registers became empty at the beginning of an odd time slot. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TODFE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TODFE is cleared when the Core writes to all the transmit data registers of the |

Table continues on the next page...

ESAI_SAIRS field descriptions (continued)

| Field | Description |
|-------------------|---|
| | enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TODFE is set. Hardware, software, ESAI individual reset clear TODFE. |
| 16 TEDE | ESAI_SAIRS Transmit Even-Data Register Empty. When set, TEDE indicates that the enabled transmitter data registers became empty at the beginning of an even time slot. Even time slots are all even-numbered slots (0, 2, 4, 6, etc.). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TEDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TEDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TEDE is set. Hardware, software, ESAI individual reset clear TEDE. |
| 15 TDE | ESAI_SAIRS Transmit Data Register Empty. TDE is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TDE is set. Hardware, software, ESAI individual reset clear TDE. |
| 14 TUE | ESAI_SAIRS Transmit Underrun Error Flag. TUE is set when at least one of the enabled serial transmit shift registers is empty (no new data to be transmitted) and a transmit time slot occurs. When a transmit underrun error occurs, the previous data (which is still present in the TX registers that were not written) is retransmitted. If TEIE is set, an ESAI transmit data with exception (underrun error) interrupt request is issued when TUE is set. Hardware, software, ESAI individual reset clear TUE. TUE is also cleared by reading the ESAI_SAIRS with TUE set, followed by writing to all the enabled transmit data registers or to ESAI_TSR. |
| 13 TFS | ESAI_SAIRS Transmit Frame Sync Flag. When set, TFS indicates that a transmit frame sync occurred in the current time slot. TFS is set at the start of the first time slot in the frame and cleared during all other time slots. Data written to a transmit data register during the time slot when TFS is set is transmitted (in network mode), if the transmitter is enabled, during the second time slot in the frame. TFS is useful in network mode to identify the start of a frame. TFS is cleared by hardware, software, ESAI individual reset. TFS is valid only if at least one transmitter is enabled, that is, one or more of TE0, TE1, TE2, TE3, TE4 and TE5 are set. (In normal mode, TFS always reads as a one when transmitting data because there is only one time slot per frame - the "frame sync" time slot) |
| 12–11 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 10 RODF | ESAI_SAIRS Receive Odd-Data Register Full. When set, RODF indicates that the received data in the receive data registers of the enabled receivers have arrived during an odd time slot when operating in the network mode. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. RODF is set when the contents of the receive shift registers are transferred to the receive data registers. RODF is cleared when the Core reads all the enabled receive data registers or cleared by hardware, software, ESAI individual resets. |
| 9 REDF | ESAI_SAIRS Receive Even-Data Register Full. When set, REDF indicates that the received data in the receive data registers of the enabled receivers have arrived during an even time slot when operating in the network mode. Even time slots are all even-numbered slots (0, 2, 4, 6, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. REDF is set when the contents of the receive shift registers are transferred to the receive data registers. REDF is cleared when the Core reads all the enabled receive data registers or |

Table continues on the next page...

ESAI_SAISR field descriptions (continued)

| Field | Description |
|-----------------|---|
| | cleared by hardware, software, ESAI individual resets. If REDIE is set, an ESAI receive even slot data interrupt request is issued when REDF is set. |
| 8 RDF | ESAI_SAISR Receive Data Register Full. RDF is set when the contents of the receive shift register of an enabled receiver is transferred to the respective receive data register. RDF is cleared when the Core reads the receive data register of all enabled receivers or cleared by hardware, software, ESAI individual reset. If RIE is set, an ESAI receive data interrupt request is issued when RDF is set. |
| 7 ROE | ESAI_SAISR Receive Overrun Error Flag. The ROE flag is set when the serial receive shift register of an enabled receiver is full and ready to transfer to its receiver data register (RXn) and the register is already full (RDF=1). If REIE is set, an ESAI receive data with exception (overrun error) interrupt request is issued when ROE is set. Hardware, software, ESAI individual reset clear ROE. ROE is also cleared by reading the SAISR with ROE set, followed by reading all the enabled receive data registers. |
| 6 RFS | ESAI_SAISR Receive Frame Sync Flag. When set, RFS indicates that a receive frame sync occurred during reception of the words in the receiver data registers. This indicates that the data words are from the first slot in the frame. When RFS is clear and a word is received, it indicates (only in the network mode) that the frame sync did not occur during reception of that word. RFS is cleared by hardware, software, ESAI individual reset. RFS is valid only if at least one of the receivers is enabled (REx=1). (In normal mode, RFS always reads as a one when reading data because there is only one time slot per frame - the "frame sync" time slot) |
| 5–3 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 2 IF2 | ESAI_SAISR Serial Input Flag 2. The IF2 bit is enabled only when the HCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RHCKD=0, indicating that HCKR is an input flag and the synchronous mode is selected. Data present on the HCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF2 bit is updated with this data when the receive shift registers are transferred into the receiver data registers. IF2 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF2. |
| 1 IF1 | ESAI_SAISR Serial Input Flag 1. The IF1 bit is enabled only when the FSR pin is defined as ESAI in the Port Control Register, SYN=1, RFSD=0 and TEBE=0, indicating that FSR is an input flag and the synchronous mode is selected. Data present on the FSR pin is latched during reception of the first received data bit after frame sync is detected. The IF1 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF1 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF1. |
| 0 IF0 | ESAI_SAISR Serial Input Flag 0. The IF0 bit is enabled only when the SCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RCKD=0, indicating that SCKR is an input flag and the synchronous mode is selected. Data present on the SCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF0 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF0 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF0. |

25.6.13 Serial Audio Interface Control Register (ESAI_SAICR)

The read/write Common Control Register (ESAI_SAICR) contains control bits for functions that affect both the receive and transmit sections of the ESAI.

ESAI_SAICR field descriptions

| Field | Description |
|------------------|---|
| 31–9 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 8 ALC | ESAI_SAICR Alignment Control. The ESAI is designed for 24-bit fractional data, thus shorter data words are left aligned to the MSB (bit 23). Some applications use 16-bit fractional data. In those cases, shorter data words may be left aligned to bit 15. The Alignment Control (ALC) bit supports these applications. If ALC is set, transmitted and received words are left aligned to bit 15 in the transmit and receive shift registers. If ALC is cleared, transmitted and received word are left aligned to bit 23 in the transmit and receive shift registers. While ALC is set, 20-bit and 24-bit words may not be used, and word length control should specify 8-, 12-, or 16-bit words; otherwise, results are unpredictable. |
| 7 TEBE | ESAI_SAICR Transmit External Buffer Enable. The Transmitter External Buffer Enable (TEBE) bit controls the function of the FSR pin when in the synchronous mode. If the ESAI is configured for operation in the synchronous mode (SYN=1), and TEBE is set while FSR pin is configured as an output (RFSD=1), the FSR pin functions as the transmitter external buffer enable control to enable the use of an external buffers on the transmitter outputs. If TEBE is cleared, the FSR pin functions as the serial I/O flag 1. See Port C Control Register for a summary of the effects of TEBE on the FSR pin. |
| 6 SYN | ESAI_SAICR Synchronous Mode Selection. The Synchronous Mode Selection (SYN) bit controls whether the receiver and transmitter sections of the ESAI operate synchronously or asynchronously with respect to each other (see Port C Control Register). When SYN is cleared, the asynchronous mode is chosen and independent clock and frame sync signals are used for the transmit and receive sections. When SYN is set, the synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals. When in the synchronous mode (SYN=1), the transmit and receive sections use the transmitter section clock generator as the source of the clock and frame sync for both sections. Also, the receiver clock pins SCKR, FSR and HCKR now operate as I/O flags. Refer to Table 25-39 , Table 25-40 , and Table 25-41 for the effects of SYN on the receiver clock pins. |
| 5–3 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 2 OF2 | ESAI_SAICR Serial Output Flag 2. The Serial Output Flag 2 (OF2) is a data bit used to hold data to be send to the OF2 pin. When the ESAI is in the synchronous clock mode (SYN=1), the HCKR pin is configured as the ESAI flag 2. If the receiver high frequency clock direction bit (RHCKD) is set, the HCKR pin is the output flag OF2, and data present in the OF2 bit is written to the OF2 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode. |
| 1 OF1 | ESAI_SAICR Serial Output Flag 1. The Serial Output Flag 1 (OF1) is a data bit used to hold data to be send to the OF1 pin. When the ESAI is in the synchronous clock mode (SYN=1), the FSR pin is configured as the ESAI flag 1. If the receiver frame sync direction bit (RFSD) is set and the TEBE bit is cleared, the FSR pin is the output flag OF1, and data present in the OF1 bit is written to the OF1 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode. |

Table continues on the next page...

ESAI_SAICR field descriptions (continued)

| Field | Description |
|----------|--|
| 0 OF0 | ESAI_SAICR Serial Output Flag 0. The Serial Output Flag 0 (OF0) is a data bit used to hold data to be send to the OF0 pin. When the ESAI is in the synchronous clock mode (SYN=1), the SCKR pin is configured as the ESAI flag 0. If the receiver serial clock direction bit (RCKD) is set, the SCKR pin is the output flag OF0, and data present in the OF0 bit is written to the OF0 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode. |

25.6.14 Transmit Control Register (ESAI_TCR)

The read/write Transmit Control Register (ESAI_TCR) controls the ESAI transmitter section. Interrupt enable bits for the transmitter section are provided in this control register. Operating modes are also selected in this register.

ESAI_TCR field descriptions

| Field | Description |
|-------------------|---|
| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23 TLIE | ESAI_TCR Transmit Last Slot Interrupt Enable. TLIE enables an interrupt at the beginning of last slot of a frame in network mode. When TLIE is set the Core is interrupted at the start of the last slot in a frame in network mode regardless of the transmit mask register setting. When TLIE is cleared the transmit last slot interrupt is disabled. TLIE is disabled when TDC[4:0]=0x00000 (on-demand mode). The use of the transmit last slot interrupt is described in ESAI Interrupt Requests . |
| 22 TIE | ESAI_TCR Transmit Interrupt Enable. The Core is interrupted when TIE and the TDE flag in the ESAI_SAISR status register are set. When TIE is cleared, this interrupt is disabled. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears TDE, thus clearing the interrupt. Transmit interrupts with exception have higher priority than normal transmit data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller. |
| 21 TEDIE | ESAI_TCR Transmit Even Slot Data Interrupt Enable. The TEDIE control bit is used to enable the transmit even slot data interrupts. If TEDIE is set, the transmit even slot data interrupts are enabled. If TEDIE is cleared, the transmit even slot data interrupts are disabled. A transmit even slot data interrupt request is generated if TEDIE is set and the TEDE status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot in the frame is marked by the frame sync signal and is considered to be even. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears the TEDE flag, thus servicing the interrupt. Transmit interrupts with exception have higher priority than transmit even slot data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller. |
| 20 TEIE | ESAI_TCR Transmit Exception Interrupt Enable. When TEIE is set, the Core is interrupted when both TDE and TUE in the ESAI_SAISR status register are set. When TEIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by writing to all the data registers of the enabled transmitters clears TUE, thus clearing the pending interrupt. |
| 19 TPR | ESAI_TCR Transmit Section Personal Reset. The TPR control bit is used to put the transmitter section of the ESAI in the personal reset state. The receiver section is not affected. When TPR is cleared, the transmitter section may operate normally. When TPR is set, the transmitter section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The transmitter data pins are tri-stated while in the personal reset state; if a stable logic level is desired, the transmitter data pins should be defined as GPIO outputs, or external pull-up or pull-down resistors should be used. The |

Table continues on the next page...

ESAI_TCR field descriptions (continued)

| Field | Description |
|----------------------|---|
| | transmitter clock outputs drive zeroes while in the personal reset state. Note that to leave the personal reset state by clearing TPR, the procedure described in ESAI Initialization Examples should be followed. |
| 18 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 17 PADC | ESAI_TCR Transmit Zero Padding Control. When PADC is cleared, zero padding is disabled. When PADC is set, zero padding is enabled. PADC, in conjunction with the TWA control bit, determines the way that padding is done for operating modes where the word length is less than the slot length. See the TWA bit description in bit 7 for more details. Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule: If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted. If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word. |
| 16 TFSR | ESAI_TCR Transmit Frame Sync Relative Timing. TFSR determines the relative timing of the transmit frame sync signal as referred to the serial data lines, for a word length frame sync only (TFSL=0). When TFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When TFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word. |
| 15 TFSL | ESAI_TCR Transmit Frame Sync Length. The TFSL bit selects the length of frame sync to be generated or recognized. If TFSL is cleared, a word-length frame sync is selected. If TFSL is set, a 1-bit clock period frame sync is selected. See Figure 1-21 for examples of frame length selection. |
| 14–10 TSWS[14:10] | ESAI_TCR Tx Slot and Word Length Select (TSWS4-TSWS0). The TSWS4-TSWS0 bits are used to select the length of the slot and the length of the data words being transferred through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in Table 25-31 . See also the ESAI data path programming model in Figure 25-2 and Figure 25-3 . |
| 9–8 TMOD[9:8] | ESAI_TCR Transmit Network Mode Control (TMOD1-TMOD0). The TMOD1 and TMOD0 bits are used to define the network mode of ESAI transmitters, as shown in Table 25-31 . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in Figure 25-29 . In network mode, it is possible to transfer a word for every time slot, as shown in Figure 25-29 . For further details, refer to Modes of Operation In order to comply with AC-97 specifications, TSWS4-TSWS0 should be set to 00011 (20-bit slot, 20-bit word length), TFSL and TFSR should be cleared, and TDC4-TDC0 should be set to 0x0C (13 words in frame). If TMOD[1:0]=0b11 and the above recommendations are followed, the first slot and word will be 16 bits long, and the next 12 slots and words will be 20 bits long, as required by the AC97 protocol. |
| 7 TWA | ESAI_TCR Transmit Word Alignment Control. The Transmitter Word Alignment Control (TWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If TWA is cleared, the data word is left-aligned in the slot frame during transmission. If TWA is set, the data word is right-aligned in the slot frame during transmission. Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule: If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted. If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word. |

Table continues on the next page...

ESAI_TCR field descriptions (continued)

| Field | Description |
|------------|---|
| 6 TSHFD | ESAI_TCR Transmit Shift Direction. The TSHFD bit causes the transmit shift registers to shift data out MSB first when TSHFD equals zero or LSB first when TSHFD equals one (see Figure 25-2 and Figure 25-3). |
| 5 TE5 | <p>ESAI_TCR ESAI Transmit 5 Enable. TE5 enables the transfer of data from ESAI_TX5 to the transmit shift register #5. When TE5 is set and a frame sync is detected, the transmit #5 portion of the ESAI is enabled for that frame. When TE5 is cleared, the transmitter #5 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX5 when TE5 is cleared but the data is not transferred to the transmit shift register #5.</p> <p>The SDO5/SDI0 pin is the data input pin for ESAI_RX0 if TE5 is cleared and RE0 in the ESAI_RCR register is set. If both RE0 and TE5 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE0 and TE5 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE5 and setting it again disables the transmitter #5 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO5/SDI0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE5 can be left enabled.</p> |
| 4 TE4 | <p>ESAI_TCR ESAI Transmit 4 Enable. TE4 enables the transfer of data from ESAI_TX4 to the transmit shift register #4. When TE4 is set and a frame sync is detected, the transmit #4 portion of the ESAI is enabled for that frame. When TE4 is cleared, the transmitter #4 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX4 when TE4 is cleared but the data is not transferred to the transmit shift register #4.</p> <p>The SDO4/SDI1 pin is the data input pin for ESAI_RX1 if TE4 is cleared and RE1 in the RCR register is set. If both RE1 and TE4 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE1 and TE4 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE4 and setting it again disables the transmitter #4 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO4/SDI1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE4 can be left enabled.</p> |
| 3 TE3 | <p>ESAI_TCR ESAI Transmit 3 Enable. TE3 enables the transfer of data from ESAI_TX3 to the transmit shift register #3. When TE3 is set and a frame sync is detected, the transmit #3 portion of the ESAI is enabled for that frame. When TE3 is cleared, the transmitter #3 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX3 when TE3 is cleared but the data is not transferred to the transmit shift register #3.</p> <p>The SDO3/SDI2 pin is the data input pin for ESAI_RX2 if TE3 is cleared and RE2 in the ESAI_RCR register is set. If both RE2 and TE3 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE2 and TE3 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE3 and setting it again disables the transmitter #3 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO3/SDI2 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE3 can be left enabled.</p> |
| 2 TE2 | ESAI_TCR ESAI Transmit 2 Enable. TE2 enables the transfer of data from ESAI_TX2 to the transmit shift register #2. When TE2 is set and a frame sync is detected, the transmit #2 portion of the ESAI is enabled for that frame. When TE2 is cleared, the transmitter #2 is disabled after completing transmission of data |

|----------|--|
| | <p>currently in the ESAI transmit shift register. Data can be written to ESAI_TX2 when TE2 is cleared but the data is not transferred to the transmit shift register #2.</p> <p>The SDO2/SDI3 pin is the data input pin for ESAI_RX3 if TE2 is cleared and RE3 in the ESAI_RCR register is set. If both RE3 and TE2 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE3 and TE2 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE2 and setting it again disables the transmitter #2 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO2/SDI3 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE2 can be left enabled.</p> |
| 1 TE1 | <p>ESAI_TCR ESAI Transmit 1 Enable. TE1 enables the transfer of data from TX1 to the transmit shift register #1. When TE1 is set and a frame sync is detected, the transmit #1 portion of the ESAI is enabled for that frame. When TE1 is cleared, the transmitter #1 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO1 output is tri-stated, and any data present in TX1 is not transmitted, that is, data can be written to TX1 with TE1 cleared, but data is not transferred to the transmit shift register #1.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE1 and setting it again disables the transmitter #1 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE1 can be left enabled.</p> |
| 0 TE0 | <p>ESAI_TCR ESAI Transmit 0 Enable. TE0 enables the transfer of data from ESAI_TX0 to the transmit shift register #0. When TE0 is set and a frame sync is detected, the transmit #0 portion of the ESAI is enabled for that frame. When TE0 is cleared, the transmitter #0 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO0 output is tri-stated, and any data present in ESAI_TX0 is not transmitted, that is, data can be written to ESAI_TX0 with TE0 cleared, but data is not transferred to the transmit shift register #0.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE0 and setting it again disables the transmitter #0 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE0 can be left enabled.</p> |

25.6.15 Transmit Clock Control Register (ESAI_TCCR)

The read/write Transmitter Clock Control Register (ESAI_TCCR) controls the ESAI transmitter clock generator bit and frame sync rates, the bit clock and high frequency clock sources and the directions of the HCKT, FST and SCKT signals. In the synchronous mode (SYN=1), the bit clock defined for the transmitter determines the receiver bit clock as well. ESAI_TCCR also controls the number of words per frame for the serial data. Hardware and software reset clear all the bits of the ESAI_TCCR register.

Care should be taken in asynchronous mode whenever the frame sync clock (FSR, FST) is not sourced directly from its associated bit clock (SCKR, SCKT). Proper phase relationships must be maintained between these clocks in order to guarantee proper operation of the ESAI.

NOTE

ARM Core clock is ipg_clk_esai in block ESAI which is from CCM's ahb_clk_root.

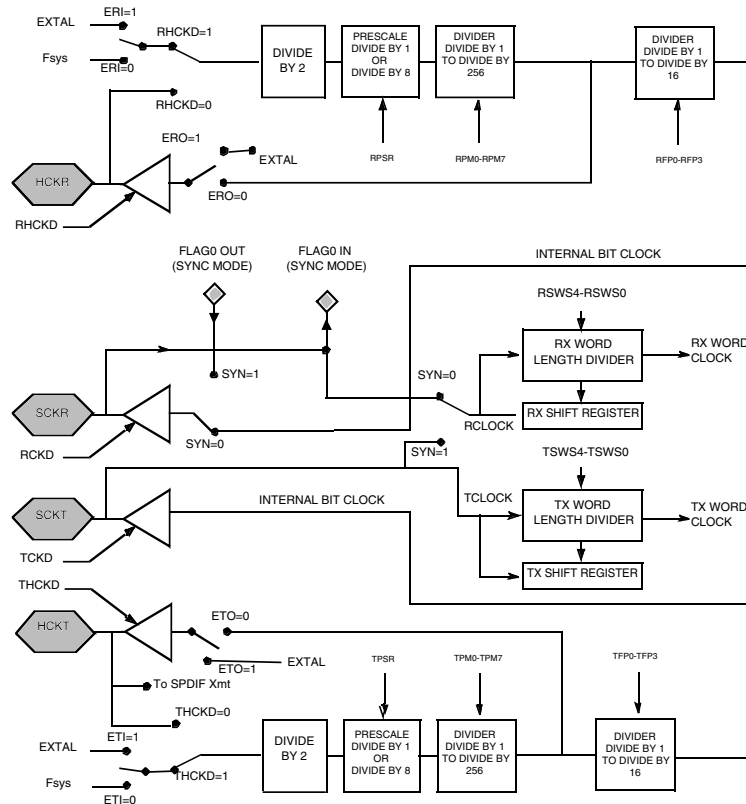

Figure 25-32. ESAI Clock Generator Functional Block Diagram

NOTE

1. ETI, ETO, ERI and ERO bit descriptions are covered in [ESAI Control Register \(ESAI_ECR\)](#).
2. Fsys is the ESAI system 133 MHz clock.
3. EXTAL is the on-chip clock sources other than ESAI system 133MHz clock.

ESAI_TCCR field descriptions

| Field | Description |
|-------------------|--|
| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23 THCKD | ESAI_TCCR Transmit High Frequency Clock Direction. THCKD controls the direction of the HCKT pin. When THCKD is cleared, HCKT is an input; when THCKD is set, HCKT is an output (see Table 25-3). |
| 22 TFSD | ESAI_TCCR Transmit Frame Sync Signal Direction. TFSD controls the direction of the FST pin. When TFSD is cleared, FST is an input; when TFSD is set, FST is an output (see Table 25-3). |
| 21 TCKD | ESAI_TCCR Transmit Clock Source Direction. The Transmitter Clock Source Direction (TCKD) bit selects the source of the clock signal used to clock the transmit shift registers in the asynchronous mode (SYN=0) and the transmit shift registers and the receive shift registers in the synchronous mode (SYN=1). When TCKD is set, the internal clock source becomes the bit clock for the transmit shift registers and word length divider and is the output on the SCKT pin. When TCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKT pin, and an external clock source may drive this pin (see Table 25-3). |
| 20 THCKP | ESAI_TCCR Transmit High Frequency Clock Polarity. The Transmitter High Frequency Clock Polarity (THCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If THCKP is cleared the data and the frame sync are clocked out on the rising edge of the transmit high frequency bit clock and latched in on the falling edge of the transmit bit clock. If THCKP is set the falling edge of the transmit clock is used to clock the data out and frame sync and the rising edge of the transmit clock is used to latch the data and frame sync in. |
| 19 TFSP | ESAI_TCCR Transmit Frame Sync Polarity. The Transmitter Frame Sync Polarity (TFSP) bit determines the polarity of the transmit frame sync signal. When TFSP is cleared, the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When TFSP is set, the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin. |
| 18 TCKP | ESAI_TCCR Transmit Clock Polarity. The Transmitter Clock Polarity (TCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If TCKP is cleared the data and the frame sync are clocked out on the rising edge of the transmit bit clock and latched in on the falling edge of the transmit bit clock. If TCKP is set the falling edge of the transmit clock is used to clock the data out and frame sync and the rising edge of the transmit clock is used to latch the data and frame sync in. |
| 17–14 TFP[3:0] | ESAI_TCCR Tx High Frequency Clock Divider. The TFP3-TFP0 bits control the divide ratio of the transmitter high frequency clock to the transmitter serial bit clock when the source of the high frequency clock and the bit clock is the internal ARM Core clock. When the HCKT input is being driven from an external high frequency clock, the TFP3-TFP0 bits specify an additional division ratio in the clock divider |

Table continues on the next page...

ESAI_TCCR field descriptions (continued)

| Field | Description |
|------------------|--|
| | chain. Table 25-33 shows the specification for the divide ratio. Figure 25-32 shows the ESAI high frequency clock generator functional diagram. |
| 13–9 TDC[4:0] | <p>ESAI_TCCR Tx Frame Rate Divider Control. The TDC4-TDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the transmitter frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (TDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (TDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (TDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of 1 (TDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (TFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in Figure 25-33</p> |
| 8 TPSR | ESAI_TCCR Transmit Prescaler Range. The TPSR bit controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When TPSR is set, the fixed prescaler is bypassed. When TPSR is cleared, the fixed divide-by-eight prescaler is operational (see Figure 25-32). The maximum internally generated bit clock frequency is $F_{sys}/4$; the minimum internally generated bit clock frequency is $F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536$. (Do not use the combination TPSR=1, TPM7-TPM0=0x00, and TFP3-TFP0=0x0 which causes synchronization problems when using the internal ARM Core clock as source (TCKD=1 or THCKD=1)) |
| 7–0 TPM[7:0] | ESAI_TCCR Transmit Prescale Modulus Select. The TPM7-TPM0 bits specify the divide ratio of the prescale divider in the ESAI transmitter clock generator. A divide ratio from 1 to 256 (TPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the transmit serial bit clock (SCKT) pin. The bit clock output is also available internally for use as the bit clock to shift the transmit and receive shift registers. The ESAI transmit clock generator functional diagram is shown in Figure 25-32 . |

25.6.16 Receive Control Register (ESAI_RCR)

The read/write Receive Control Register (ESAI_RCR) controls the ESAI receiver section. Interrupt enable bits for the receivers are provided in this control register. The receivers are enabled in this register (0,1,2 or 3 receivers can be enabled) if the input data pin is not used by a transmitter. Operating modes are also selected in this register.

ESAI_RCR field descriptions

| Field | Description |
|-------------------|--|
| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23 RLIE | ESAI_RCR Receive Last Slot Interrupt Enable. RLIE enables an interrupt after the last slot of a frame ended in network mode only. When RLIE is set the Core is interrupted after the last slot in a frame ended regardless of the receive mask register setting. When RLIE is cleared the receive last slot interrupt is disabled. Hardware and software reset clear RLIE. RLIE is disabled when RDC[4:0]=00000 (on-demand mode). The use of the receive last slot interrupt is described in ESAI Interrupt Requests . |
| 22 RIE | ESAI_RCR Receive Interrupt Enable. The Core is interrupted when RIE and the RDF flag in the ESAI_SAISR status register are set. When RIE is cleared, this interrupt is disabled. Reading the receive data registers of the enabled receivers clears RDF, thus clearing the interrupt. Receive interrupts with exception have higher priority than normal receive data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller. |
| 21 REDIE | ESAI_RCR Receive Even Slot Data Interrupt Enable. The REDIE control bit is used to enable the receive even slot data interrupts. If REDIE is set, the receive even slot data interrupts are enabled. If REDIE is cleared, the receive even slot data interrupts are disabled. A receive even slot data interrupt request is generated if REDIE is set and the REDF status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot is marked by the frame sync signal and is considered to be even. Reading all the data registers of the enabled receivers clears the REDF flag, thus servicing the interrupt. Receive interrupts with exception have higher priority than receive even slot data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller. |
| 20 REIE | ESAI_RCR Receive Exception Interrupt Enable. When REIE is set, the Core is interrupted when both RDF and ROE in the ESAI_SAISR status register are set. When REIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by reading the enabled receivers data registers clears ROE, thus clearing the pending interrupt. |
| 19 RPR | ESAI_RCR Receiver Section Personal Reset. The RPR control bit is used to put the receiver section of the ESAI in the personal reset state. The transmitter section is not affected. When RPR is cleared, the receiver section may operate normally. When RPR is set, the receiver section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The receiver data pins are disconnected while in the personal reset state. |

Table continues on the next page...

ESAI_RCR field descriptions (continued)

| Field | Description |
|--------------------|---|
| | NOTE: To leave the personal reset state by clearing RPR, the procedure described in ESAI Initialization Examples should be followed. |
| 18–17 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 16 RFSR | ESAI_RCR Receiver Frame Sync Relative Timing. RFSR determines the relative timing of the receive frame sync signal as referred to the serial data lines, for a word length frame sync only. When RFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When RFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word. |
| 15 RFSL | ESAI_RCR Receiver Frame Sync Length. The RFSL bit selects the length of the receive frame sync to be generated or recognized. If RFSL is cleared, a word-length frame sync is selected. If RFSL is set, a 1-bit clock period frame sync is selected. Refer to Figure 25-30 for examples of frame length selection. |
| 14–10 RSWS[4:0] | ESAI_RCR Receiver Slot and Word Select. The RSWS4-RSWS0 bits are used to select the length of the slot and the length of the data words being received through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in Table 25-36 . See also the ESAI data path programming model in Figure 25-2 and Figure 25-3 . |
| 9–8 RMOD[1:0] | ESAI_RCR Receiver Network Mode Control. The RMOD1 and RMOD0 bits are used to define the network mode of the ESAI receivers, as shown in Table 25-35 . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in Figure 25-29 . In network mode, it is possible to transfer a word for every time slot, as shown in Figure 25-29 . For more details, see Modes of Operation . In order to comply with AC-97 specifications, RSWS4-RSWS0 should be set to 0x00011 (20-bit slot, 20-bit word); RFSL and RFSR should be cleared, and RDC4-RDC0 should be set to 0x0C (13 words in frame). |
| 7 RWA | ESAI_RCR Receiver Word Alignment Control. The Receiver Word Alignment Control (RWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If RWA is cleared, the data word is assumed to be left-aligned in the slot frame. If RWA is set, the data word is assumed to be right-aligned in the slot frame. If the data word is shorter than the slot length, the data bits which are not in the data word field are ignored. For data word lengths of less than 24 bits, the data word is right-extended with zeroes before being stored in the receive data registers. |
| 6 RSHFD | ESAI_RCR Receiver Shift Direction. The RSHFD bit causes the receiver shift registers to shift data in MSB first when RSHFD is cleared or LSB first when RSHFD is set (see Figure 25-2 and Figure 25-3). |
| 5–4 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 3 RE3 | ESAI_RCR ESAI Receiver 3 Enable. When RE3 is set and TE2 is cleared, the ESAI receiver 3 is enabled and samples data at the SDO2/SDI3 pin. ESAI_TX2 and ESAI_RX3 should not be enabled at the same time (RE3=1 and TE2=1). When RE3 is cleared, receiver 3 is disabled by inhibiting data transfer into ESAI_RX3. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX3 data register. If RE3 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX3 will be invalid and must be discarded. |
| 2 RE2 | ESAI_RCR ESAI Receiver 2 Enable. When RE2 is set and TE3 is cleared, the ESAI receiver 2 is enabled and samples data at the SDO3/SDI2 pin. ESAI_TX3 and ESAI_RX2 should not be enabled at the same time (RE2=1 and TE3=1). When RE2 is cleared, receiver 2 is disabled by inhibiting data transfer into ESAI_RX2. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX2 data register. If RE2 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX2 will be invalid and must be discarded. |

Table continues on the next page...

ESAI_RCR field descriptions (continued)

| Field | Description |
|----------|--|
| 1 RE1 | <p>ESAI_RCR ESAI Receiver 1 Enable. When RE1 is set and TE4 is cleared, the ESAI receiver 1 is enabled and samples data at the SDO4/SDI1 pin. ESAI_TX4 and ESAI_RX1 should not be enabled at the same time (RE1=1 and TE4=1). When RE1 is cleared, receiver 1 is disabled by inhibiting data transfer into ESAI_RX1. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX1 data register.</p> <p>If RE1 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX1 will be invalid and must be discarded.</p> |
| 0 RE0 | <p>ESAI_RCR ESAI Receiver 0 Enable. When RE0 is set and TE5 is cleared, the ESAI receiver 0 is enabled and samples data at the SDO5/SDI0 pin. ESAI_TX5 and ESAI_RX0 should not be enabled at the same time (RE0=1 and TE5=1). When RE0 is cleared, receiver 0 is disabled by inhibiting data transfer into ESAI_RX0. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX0 data register.</p> <p>If RE0 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX0 will be invalid and must be discarded.</p> |

25.6.17 Receive Clock Control Register (ESAI_RCCR)

The read/write Receiver Clock Control Register (ESAI_RCCR) controls the ESAI receiver clock generator bit and frame sync rates, word length, and number of words per frame for the serial data. The ESAI_RCCR control bits are described in the following paragraphs.

NOTE

ARM Core clock is ipg_clk_esai in block ESAI which is from CCM's ahb_clk_root.

Table 25-38. Receiver High Frequency Clock Divider

ESAI_RCCR field descriptions

| Field | Description |
|-------------------|--|
| 31–24 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 23 RHCKD | <p>ESAI_RCCR Receiver High Frequency Clock Direction. The Receiver High Frequency Clock Direction (RHCKD) bit selects the source of the receiver high frequency clock when in the asynchronous mode (SYN=0) and the IF2/OF2 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RHCKD is set, the internal clock generator becomes the source of the receiver high frequency clock and is the output on the HCKR pin. In the asynchronous mode, when RHCKD is cleared, the receiver high frequency clock source is external; the internal clock generator is disconnected from the HCKR pin, and an external clock source may drive this pin.</p> <p>When RHCKD is cleared, HCKR is an input; when RHCKD is set, HCKR is an output.</p> <p>In the synchronous mode when RHCKD is set, the HCKR pin becomes the OF2 output flag. If RHCKD is cleared, the HCKR pin becomes the IF2 input flag. Refer to Table 25-2 and Table 25-41.</p> |
| 22 RFSD | <p>ESAI_RCCR Receiver Frame Sync Signal Direction. The Receiver Frame Sync Signal Direction (RFSD) bit selects the source of the receiver frame sync signal when in the asynchronous mode (SYN=0) and the IF1/OF1/Transmitter Buffer Enable flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RFSD is set, the internal clock generator becomes the source of the receiver frame sync and is the output on the FSR pin. In the asynchronous mode, when RFSD is cleared, the receiver frame sync source is external; the internal clock generator is disconnected from the FSR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RFSD is set, the FSR pin becomes the OF1 output flag or the Transmitter Buffer Enable, according to the TEBE control bit. If RFSD is cleared, the FSR pin becomes the IF1 input flag. Refer to Table 25-2 and Table 25-40.</p> |
| 21 RCKD | <p>ESAI_RCCR Receiver Clock Source Direction. The Receiver Clock Source Direction (RCKD) bit selects the source of the clock signal used to clock the receive shift register in the asynchronous mode (SYN=0) and the IF0/OF0 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RCKD is set, the internal clock source becomes the bit clock for the receive shift registers and word length divider and is the output on the SCKR pin. In the asynchronous mode when RCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RCKD is set, the SCKR pin becomes the OF0 output flag. If RCKD is cleared, the SCKR pin becomes the IF0 input flag. Refer to Table 25-2 and Table 25-39.</p> |
| 20 RHCKP | ESAI_RCCR Receiver High Frequency Clock Polarity. The Receiver High Frequency Clock Polarity (RHCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RHCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive high frequency bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RHCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in. |
| 19 RFSP | ESAI_RCCR Receiver Frame Sync Polarity. The Receiver Frame Sync Polarity (RFSP) determines the polarity of the receive frame sync signal. When RFSP is cleared the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When RFSP is set the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin. |
| 18 RCKP | The Receiver Clock Polarity (RCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in. |
| 17–14 RFP[3:0] | ESAI_RCCR Rx High Frequency Clock Divider. The RFP3-RFP0 bits control the divide ratio of the receiver high frequency clock to the receiver serial bit clock when the source of the receiver high frequency clock and the bit clock is the internal Arm Core clock. When the HCKR input is being driven |

Table continues on the next page...

ESAI_RCCR field descriptions (continued)

| Field | Description |
|------------------|--|
| | from an external high frequency clock, the RFP3-RFP0 bits specify an additional division ration in the clock divider chain. Table 25-38 provides the specification of the divide ratio. Figure 25-32 shows the ESAI high frequency generator functional diagram. |
| 13–9 RDC[4:0] | <p>ESAI_RCCR Rx Frame Rate Divider Control. The RDC4-RDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the receiver frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (RDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (RDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (RDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of one (RDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (RFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in Figure 25-33.</p> |
| 8 RPSR | ESAI_RCCR Receiver Prescaler Range. The RPSR controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When RPSR is set, the fixed prescaler is bypassed. When RPSR is cleared, the fixed divide-by-eight prescaler is operational (see Figure 25-32). The maximum internally generated bit clock frequency is $F_{sys}/4$, the minimum internally generated bit clock frequency is $F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536$. (Do not use the combination RPSR=1 and RPM7-RPM0 =0x00, which causes synchronization problems when using the internal Core clock as source (RHCKD=1 or RCKD=1)) |
| 7–0 RPM[7:0] | ESAI_RCCR Receiver Prescale Modulus Select. The RPM7-RPM0 bits specify the divide ratio of the prescale divider in the ESAI receiver clock generator. A divide ratio from 1 to 256 (RPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the receiver serial bit clock (SCKR) pin. The bit clock output is also available internally for use as the bit clock to shift the receive shift registers. The ESAI receive clock generator functional diagram is shown in Figure 25-32 . |

25.6.18 Transmit Slot Mask Register A (ESAI_TSMA)

The Transmit Slot Mask Register A together with Transmit Slot Mask Register B (ESAI_TSMA and ESAI_TSMB) are two read/write registers used by the transmitters in network mode to determine for each slot whether to transmit a data word and generate a transmitter empty condition (TDE=1), or to tri-state the transmitter data pins. Fields ESAI_TSMA [TS[15:0]] and ESAI_TSMB [TS[31:16]] are concatenated to form the 32-bit field TS[31:0]. Bit number *n* in TS[31:0] is the enable/disable control bit for transmission in slot number *n*.

ESAI_TSMA field descriptions

| Field | Description |
|-------------------|---|
| 31–16 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 15–0 TS[15:0] | <p>When bit number N in ESAI_TSMA is cleared, all the transmit data pins of the enabled transmitters are tri-stated during transmit time slot number N. The data is still transferred from the transmit data registers to the transmit shift registers but neither the TDE nor the TUE flags are set. This means that during a disabled slot, no transmitter empty interrupt is generated. The Core is interrupted only for enabled slots. Data that is written to the transmit data registers when servicing this request is transmitted in the next enabled transmit time slot.</p> <p>When bit number N in ESAI_TSMA register is set, the transmit sequence is as usual: data is transferred from the TX registers to the shift registers and transmitted during slot number N, and the TDE flag is set.</p> <p>Using the slot mask in ESAI_TSMA does not conflict with using TSR. Even if a slot is enabled in ESAI_TSMA, the user may choose to write to TSR instead of writing to the transmit data registers TXn. This causes all the transmit data pins of the enabled transmitters to be tri-stated during the next slot.</p> <p>Data written to the ESAI_TSMA affects the next frame transmission. The frame being transmitted is not affected by this data and would comply to the last ESAI_TSMA setting. Data read from ESAI_TSMA returns the last written data.</p> <p>After hardware or software reset, the ESAI_TSMA register is preset to 0x0000FFFF, which means that all 16 possible slots are enabled for data transmission.</p> <p>When operating in normal mode, bit 0 of the ESAI_TSMA register must be set, otherwise no output is generated.</p> |

25.6.19 Transmit Slot Mask Register B (ESAI_TSMB)

The Transmit Slot Mask Register B together with Transmit Slot Mask Register A (ESAI_TSMA and ESAI_TSMB) are two read/write registers used by the transmitters in network mode to determine for each slot whether to transmit a data word and generate a transmitter empty condition (TDE=1), or to tri-state the transmitter data pins. Fields ESAI_TSMA [TS[15:0]] and ESAI_TSMB [TS[31:16]] are concatenated to form the 32-bit field TS[31:0]. Bit number n in TS[31:0] is the enable/disable control bit for transmission in slot number n.

25.6.22 Port C Direction Register (ESAI_PPRC)

There are two registers to control the ESAI personal reset status: Port C Direction Register (ESAI_PPRC) and Port C Control Register (ESAI_PCRC).

The read/write 32-bit Port C Direction Register (ESAI_PPRC) in conjunction with the Port C Control Register (ESAI_PCRC) controls the functionality of the ESAI personal reset state. [Table 25-48](#) provides the port pin configurations. Hardware and software reset clear all ESAI_PPRC bits.

Address: 202_4000h base + F8h offset = 202_40F8h

Chapter 26

Flexible Controller Area Network (FLEXCAN)

26.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported.

26.1.1 Block Diagram

A general block diagram is shown in the figure below, which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

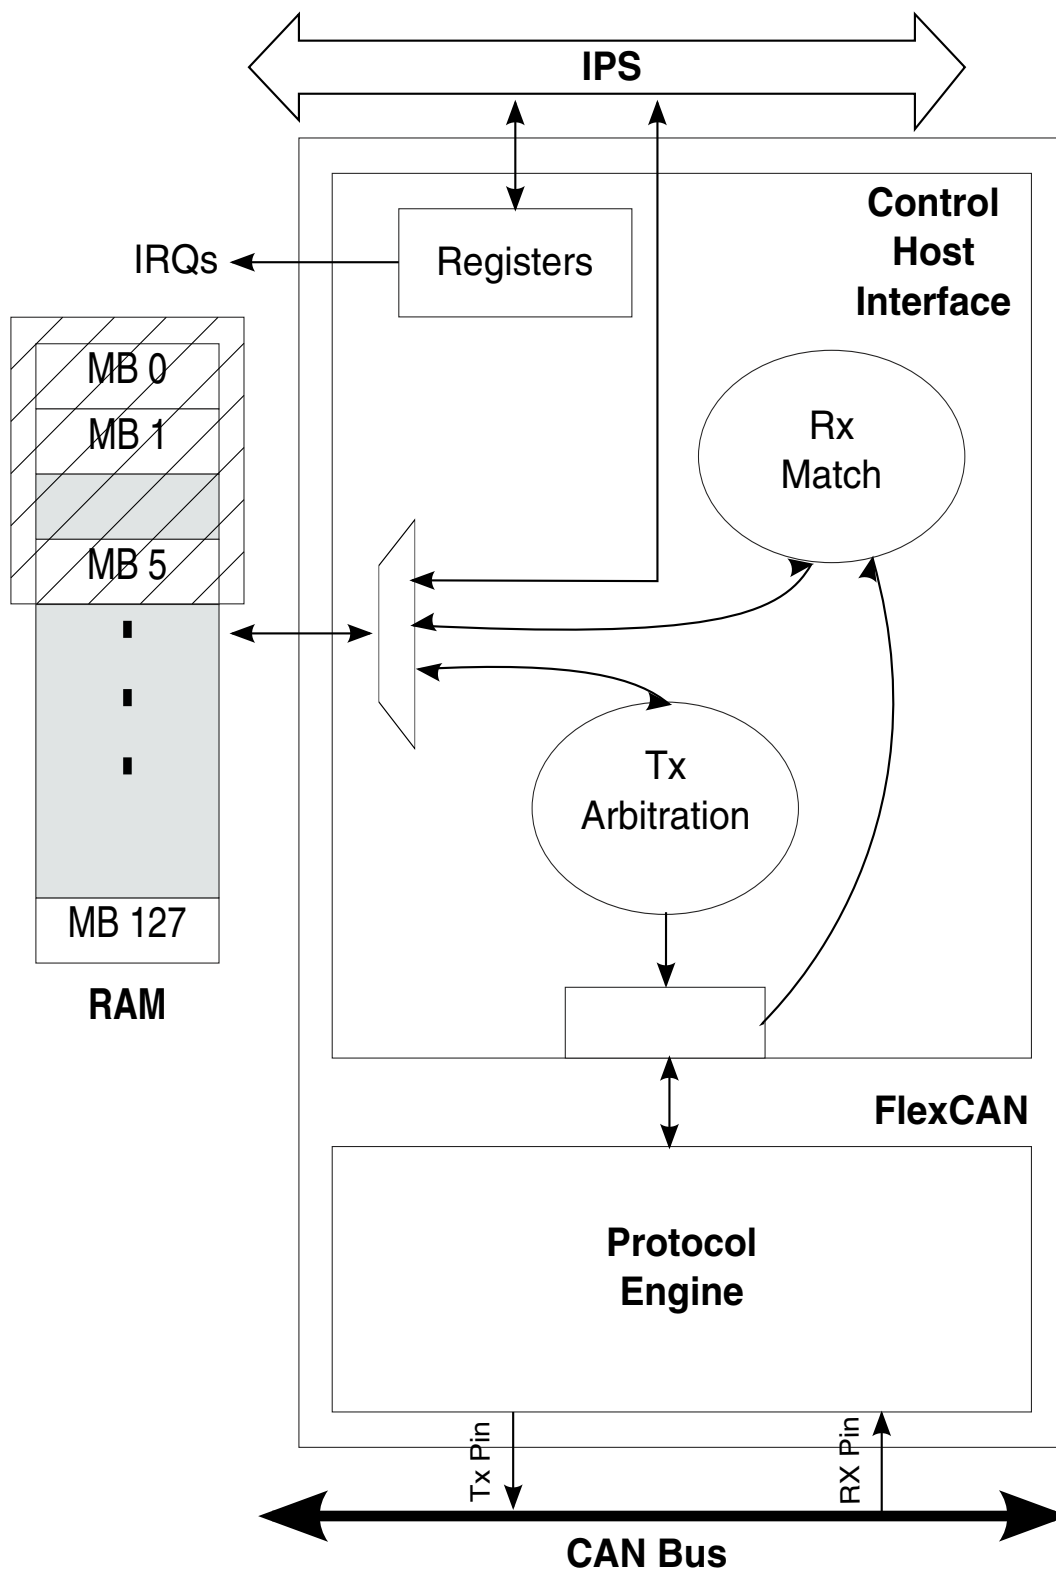

Figure 26-1. FLEXCAN Block Diagram

26.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
 - Standard data and remote frames
 - Extended data and remote frames
 - Zero to eight bytes data length
 - Programmable bit rate up to 1 Mb/sec
 - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

26.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ_ACK bit in the MCR Register is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See [Freeze Mode](#) for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See [Module Disable Mode](#) for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at ARM level and the LPM_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the ARM that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See [Stop Mode](#) for more information.

26.2 External Signals

The FLEXCAN module has two I/O signals.

Table 26-1. FLEXCAN External Signals

| Signal | Description | Pad | Mode | Direction |
|-------------|---|----------|------|-----------|
| FLEXCAN1_RX | FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'. | GPIO_8 | ALT3 | I |
| | | KEY_ROW2 | ALT2 | |
| | | SD3_CLK | ALT2 | |
| FLEXCAN1_TX | FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'. | GPIO_7 | ALT3 | O |
| | | KEY_COL2 | ALT2 | |
| | | SD3_CMD | ALT2 | |
| FLEXCAN2_RX | FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'. | KEY_ROW4 | ALT0 | I |
| | | SD3_DAT1 | ALT2 | |
| FLEXCAN2_TX | FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'. | KEY_COL4 | ALT0 | O |
| | | SD3_DAT0 | ALT2 | |

26.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 26-2. FLEXCAN Clocks

| Clock name | Clock Root | Description |
|-------------------|--------------|-----------------------------------|
| ipg_clk | ipg_clk_root | Peripheral clock |
| ipg_clk_chi | ipg_clk_root | CHI clock |
| ipg_clk_pe | can_clk_root | Protocol Engine clock |
| ipg_clk_pe_nogate | can_clk_root | Protocol Engine clock (no gating) |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |
| mem_ram_CLK | ipg_clk_root | RAM clock |

26.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C

The Message Buffer structure used by the FLEXCAN module is represented in the figure found here.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

Table 26-3. Message Buffer Structure

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|-------------|----|----|-------------|------|----|----|----|-------------|-------------|-------------|-------------|-----|-------------|----|----|-------------|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| 0x0 | | | | | CODE | | | | | S R R | I D E | R T R | DLC | | | | TIME STAMP | | | | | | | | | | | | | | | |
| 0x4 | PRIO | | | ID Standard | | | | | | | | | | ID Extended | | | | | | | | | | | | | | | | | | |
| 0x8 | DATA BYTE 0 | | | | | | | | DATA BYTE 1 | | | | | | | | DATA BYTE 2 | | | | | | | | DATA BYTE 3 | | | | | | | |
| 0xC | DATA BYTE 4 | | | | | | | | DATA BYTE 5 | | | | | | | | DATA BYTE 6 | | | | | | | | DATA BYTE 7 | | | | | | | |

CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See [Functional Description](#) for additional information.

Table 26-4. Message Buffer Code for Rx buffers

| CODE Description | Rx Code BEFORE receive New Frame | SRV ¹ | Rx Code AFTER successful reception ² | RRS ³ | Comment |
|--|----------------------------------|------------------|---|------------------|--|
| 0b0000: INACTIVE - MB is not active. | INACTIVE | - | - | - | MB does not participate in the matching process. |
| 0b0100: EMPTY - MB is active and empty. | EMPTY | - | FULL | - | When a frame is received successfully (after move-in process. Refer to Move-in for details), the CODE field is automatically updated to FULL. |
| 0b0010: FULL - MB is full. | FULL | Yes | FULL | - | The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to Matching Process for matching details related to FULL code. |
| | | No | OVERRUN | - | If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to Matching Process for details about overrun behavior. |
| 0b0110: OVERRUN - MB is being overwritten into a full buffer. | OVERRUN | Yes | FULL | - | If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL. |
| | | No | OVERRUN | - | If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to Matching Process for details about overrun behavior. |
| 0b1010: RANSWER ⁴ - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return. | RANSWER | - | TANSWER(0b1110) | 0 | A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to Matching Process for details. If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received. |
| | | | - | 1 | This code is ignored during matching and arbitration process. Refer to Matching Process for details. |

Table continues on the next page...

Table 26-4. Message Buffer Code for Rx buffers (continued)

| CODE Description | Rx Code BEFORE receive New Frame | SRV ¹ | Rx Code AFTER successful reception ² | RRS ³ | Comment |
|---|----------------------------------|------------------|---|------------------|---|
| CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB. | BUSY ⁵ | - | FULL OVERRUN | - - | Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE. |

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to [Move-in](#) for details)
3. Remote Request Stored bit from CTRL2 register. Refer to [CTRL2](#) for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

Table 26-5. Message Buffer Code for Tx buffers

| CODE Description | Tx Code BEFORE tx frame | MB RTR | Tx Code AFTER successful transmission | Comment |
|---|-------------------------|--------|---------------------------------------|---|
| 0b1000: INACTIVE - MB is not active | INACTIVE | - | - | MB does not participate in the arbitration process. |
| 0b1001: ABORT - MB is aborted | ABORT | - | - | MB does not participate in the arbitration process. . |
| 0b1100: DATA - MB is a Tx Data Frame (MB RTR must be 0) | DATA | 0 | INACTIVE | Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state. |
| 0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1) | REMOTE | 1 | EMPTY | Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID. |
| 0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame | TANSWER | - | RANSWER | This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect. The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to Matching Process and Arbitration process for details. |

SRR - Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

IDE - ID Extended Bit

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

RTR - Remote Transmission Request

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in [Control 2 Register \(FLEXCAN_CTRL2\)](#) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

DLC - Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the ARM and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTES are valid as shown in the table below.

TIME STAMP - Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

PRIOR - Local priority

This 3-bit field is only used when MCR[LPRIOR_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See [Arbitration process](#).

ID - Frame Identifier

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

DATA BYTE 0-7 - Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (n) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

Table 26-6. DATA BYTEs validity

| DLC | Valid DATA BYTEs |
|-----|------------------|
| 0 | none |
| 1 | DATA BYTE 0 |
| 2 | DATA BYTE 0-1 |
| 3 | DATA BYTE 0-2 |
| 4 | DATA BYTE 0-3 |
| 5 | DATA BYTE 0-4 |
| 6 | DATA BYTE 0-5 |
| 7 | DATA BYTE 0-6 |
| 8 | DATA BYTE 0-7 |

26.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from \$80 to \$DC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO. [Table 26-7](#) shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. [Table 26-8](#), [Table 26-9](#) and [Table 26-10](#) show the IDAF indexation. [Table 26-11](#) show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See [Rx FIFO](#) for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

Table 26-7. Rx FIFO Structure

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

|---|------------------------------|------------------------------|-----------------------------|----------------------------|

RTR - Remote Frame

This bit specifies whether Remote Request Frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is a Remote Request Frame or not.

1= Remote Frames can be accepted and data frames are rejected

0= Remote Frames are rejected and data frames can be accepted

IDE - Extended Frame

Specifies if either Extended or Standard Format frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is of the Extended or Standard Format.

1= Extended frames can be accepted and standard frames are rejected

0= Extended frames are rejected and standard frames can be accepted

RXIDA - Rx Frame Identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

RXIDB_0, RXIDB_1 - Rx Frame Identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

RXIDC_0, RXIDC_1, RXIDC_2, RXIDC_3 - Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

26.6 Functional Description

This section provides a complete functional description of the block.

26.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames.

The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see [Message Buffer Structure](#)). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the MB with a range of Identifiers on received CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to [Table 26-4](#)). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to [Table 26-5](#)).

26.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see

Transmission Abort Mechanism). If backwards compatibility is desired (MCR[AEN] bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see **Message Buffer Inactivation**).

3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see **Table 26-4** and **Table 26-5** in **Message Buffer Structure**)

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

26.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See **Control 2 Register (FLEXCAN_CTRL2)** for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When ARM write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.

- When CHI is in Idle state and ARM writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO_EN] bits settings.

26.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO_EN] bit has no effect when CTRL1[LBUF] is asserted.

26.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO_EN] bit setting.

26.6.3.2.1 Local Priority disabled

If MCR[LPRIO_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see [Table 26-12](#)) in such a way that the Local Priority is disabled.

Table 26-12. Composition of the arbitration value when Local Priority is disabled

| Format | Mailbox Arbitration Value (32 bits) | | | | |
|-----------------------|-------------------------------------|----------------|----------------|----------------|--------------|
| Standard (IDE = 0) | Standard ID (11 bits) | RTR (1 bit) | IDE (1 bit) | - (18 bits) | - (1 bit) |

Table continues on the next page...

Table 26-12. Composition of the arbitration value when Local Priority is disabled (continued)

| | | | | | |
|-----------------------|----------------------------------|----------------|----------------|---------------------------------|----------------|
| Extended (IDE = 1) | Extended ID[28:18] (11 bits) | SRR (1 bit) | IDE (1 bit) | Extended ID[17:0] (18 bits) | RTR (1 bit) |
|-----------------------|----------------------------------|----------------|----------------|---------------------------------|----------------|

26.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

Table 26-13. Composition of the arbitration value when Local Priority is enabled

| Format | Mailbox Arbitration Value (35 bits) | | | | | |
|-----------------------|-------------------------------------|------------------------------|----------------|----------------|---------------------------------|----------------|
| Standard (IDE = 0) | PRIO (3 bits) | Standard ID (11 bits) | RTR (1 bit) | IDE (1 bit) | - (18 bits) | - (1 bit) |
| Extended (IDE = 1) | PRIO (3 bits) | Extended ID[28:18](11 bits) | SRR (1 bit) | IDE (1 bit) | Extended ID[17:0] (18 bits) | RTR (1 bit) |

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)) to optimize the arbitration start point.
- During CAN Bus Off state from TX_ERR_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)) to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.
- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

26.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see [Message Buffer Inactivation](#)), preferably with a *safe inactivation* (see [Transmission Abort Mechanism](#));
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see [Move-in](#)) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;
4. The received SRR, IDE, RTR and DLC fields are stored;
5. The CODE field in the Control and Status word is updated. (see [Table 26-4](#) and [Table 26-5](#) in Section [Message Buffer Structure](#))
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See [Message Buffer Lock Mechanism](#);
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See [Move-in](#);
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to

workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX_DIS] bit is not asserted. If MCR[SRX_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode (see [Rx FIFO](#)). Upon receiving the Frames Available in Rx FIFO interrupt (see [Interrupt Masks 1 Register \(FLEXCAN_IMASK1\)](#), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

26.6.5 Matching Process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus.

If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Please, refer to the following table for details.

Table 26-14. Matching architecture

| Structure | SMB[RTR] | CTRL2[RRS] | CTRL2[EACEN] | MB[IDE] | MB[RTR] | MB[ID] ¹ | MB[CODE] |
|-------------------|----------|------------|--------------|------------------|---------------------|----------------------|--------------------------------|
| Mailbox | 0 | - | 0 | cmp ² | no_cmp ³ | cmp_msk ⁴ | EMPTY or FULL or OVERRUN |
| Mailbox | 0 | - | 1 | cmp_msk | cmp_msk | cmp_msk | EMPTY or FULL or OVERRUN |
| Mailbox | 1 | 0 | - | cmp | no_cmp | cmp | RANSWER |
| Mailbox | 1 | 1 | 0 | cmp | no_cmp | cmp_msk | EMPTY or FULL or OVERRUN |
| Mailbox | 1 | 1 | 1 | cmp_msk | cmp_msk | cmp_msk | EMPTY or FULL or OVERRUN |
| FIFO ⁵ | - | - | - | cmp_msk | cmp_msk | cmp_msk | - |

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to [Message Buffer Structure](#) for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to [Rx FIFO Structure](#) for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no_cmp: The SMB contents are not compared with the MB contents.
4. cmp_msk: Compares the SMB contents with MB contents taking into account the masks.
5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the ARM and unlocked as described in [Message Buffer Lock Mechanism](#));
- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see [Message Buffer Inactivation](#))
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
 - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
 - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see [Message Buffer Inactivation](#)) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

Table 26-15. Matching Possibilities and Resulting Reception Structures

| RFEN | IRMQ | MRP | Matched in MB | Matched in FIFO | Reception Structure | Description |
|---|------|----------------|-------------------|----------------------|---------------------|---|
| No FIFO, only MB, match is always MB first | | | | | | |
| 0 | 0 | X ¹ | None ² | -. ³ | None | Frame lost by no match |
| 0 | 0 | X | Free ⁴ | - | FirstMB | |
| 0 | 1 | X | None | - | None | Frame lost by no match |
| 0 | 1 | X | Free | - | FirstMB | |
| 0 | 1 | X | NotFree | - | LastMB | Overrun |
| FIFO enabled, no match in FIFO is as if FIFO does not exist | | | | | | |
| 1 | 0 | X | None | None ⁵ | None | Frame lost by no match |
| 1 | 0 | X | Free | None | FirstMB | |
| 1 | 1 | X | None | None | None | Frame lost by no match |
| 1 | 1 | X | Free | None | FirstMB | |
| 1 | 1 | X | NotFree | None | LastMB | Overrun |
| FIFO enabled, Queue disabled | | | | | | |
| 1 | 0 | 0 | X | NotFull ⁶ | FIFO | |
| 1 | 0 | 0 | None | Full ⁷ | None | Frame lost by FIFO full (FIFO Overflow) |
| 1 | 0 | 0 | Free | Full | FirstMB | |
| 1 | 0 | 0 | NotFree | Full | FirstMB | |
| 1 | 0 | 1 | None | NotFull | FIFO | |
| 1 | 0 | 1 | None | Full | None | Frame lost by FIFO full (FIFO Overflow) |
| 1 | 0 | 1 | Free | X | FirstMB | |
| 1 | 0 | 1 | NotFree | X | FirstMB | Overrun |

Table continues on the next page...

**Table 26-15. Matching Possibilities and Resulting Reception Structures
(continued)**

| RFEN | IRMQ | MRP | Matched in MB | Matched in FIFO | Reception Structure | Description |
|-----------------------------|------|-----|---------------|-----------------|---------------------|---|
| FIFO enabled, Queue enabled | | | | | | |
| 1 | 1 | 0 | X | NotFull | FIFO | |
| 1 | 1 | 0 | None | Full | None | Frame lost by FIFO full (FIFO Overflow) |
| 1 | 1 | 0 | Free | Full | FirstMB | |
| 1 | 1 | 0 | NotFree | Full | LastMB | Overrun |
| 1 | 1 | 1 | None | NotFull | FIFO | |
| 1 | 1 | 1 | Free | X | FirstMB | |
| 1 | 1 | 1 | NotFree | NotFull | FIFO | |
| 1 | 1 | 1 | NotFree | Full | LastMB | Overrun |

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for ARM to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. ARM can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to [Rx Mailboxes Global Mask Register \(FLEXCAN_RXMGMASK\)](#). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode, otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

26.6.6 Move Process

There are two types of move process, namely move-in and move-out.

26.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead.

The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see [Matching Process](#)) and all of the following conditions are true:

- the CAN bus has reached or let past either:
 - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
 - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;
- the destination Mailbox is not locked by ARM;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consist of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to [Table 26-4](#).

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see [Message Buffer Inactivation](#)) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that ARM beware that the Message Buffer content is temporarily incoherent.

26.6.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see [Arbitration process](#)).

The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field
- during Wait For Bus Idle field

The move-out process is not atomic. Only ARM has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

26.6.7 Data Coherence

In order to maintain data coherency and FlexCAN proper operation, the ARM must obey the rules described in

Any form of ARM accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

26.6.7.1 Transmission Abort Mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform ARM if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, ARM must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the ARM is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to ARM.

If ARM writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way ARM just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and ARM wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. ARM checks the corresponding IFLAG and clears it, if asserted.
2. ARM writes 0b1001 into the CODE field of the C/S word.
3. ARM waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. ARM reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

26.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing ARM to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See [Transmit Process](#) and [Receive Process](#) for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox ARM must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* ARM must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see [Transmission Abort Mechanism](#));

The inactivation automatically unlocks the Mailbox (see [Message Buffer Lock Mechanism](#)).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. ARM must keep the data coherence into FIFO region when RFEN is asserted.

26.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When ARM reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that ARM wants to read the whole MB in an atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when ARM reads the Free Running Timer (global unlock operation), or when it reads the

Control and Status word of another MB regardless of its code or when ARM writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while ARM is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY¹ (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the ARM decides to read MB number 5 and at the same time another message with the same ID is arriving. When ARM reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If ARM reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If ARM inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox. An MB is unlocked when ARM reads the Free Running Timer Register (see [Free Running Timer Register \(FLEXCAN_TIMER\)](#)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in [Modes of Operation](#) specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

26.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see [Rx FIFO Structure](#)). ARM can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, ARM can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to ARM. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until ARM clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the ARM clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also [Rx FIFO Structure](#)):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to [Control 2 Register \(FLEXCAN_CTRL2\)](#)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

26.6.9 CAN Protocol Related Features

26.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this

mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.

- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the ARM. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

26.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

26.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in [Control 1 Register \(FLEXCAN_CTRL1\)](#).

26.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRESDIV, PROPSEG, PSEG1, PSEG2 and RJW. See [Control 1 Register \(FLEXCAN_CTRL1\)](#).

The PRESDIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler value})}$$

A bit time is subdivided into three segments² (reference [Table 26-16](#)):

- SYNC_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{(\text{number of Time Quanta})}$$

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

Figure 26-2. Segments within the Bit Time

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ_ACK] and MCR[LPM_ACK] in [Module Configuration Register \(FLEXCAN_MCR\)](#)), the number of peripheral clocks in one CAN bit can be calculated as:

$$NCCP = \frac{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1)] \times (PRES DIV + 1)}{f_{CANCLK}}$$

where:

NCCP is the number of peripheral clocks in one CAN bit;

f_{CANCLK} is the Protocol Engine (PE) Clock in Hz;

f_{SYS} is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRESDIV is the value in CTRL1[PRESDIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Figure 26-2 gives an overview of the CAN compliant segment settings and the related parameter values.

Table 26-16. Time Segment Syntax

| Syntax | Description |
|----------------|--|
| SYNC_SEG | System expects transitions to occur on the bus during this period. |
| Transmit Point | A node in transmit mode transfers a new value to the CAN bus at this point. |
| Sample Point | A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample. |

Table 26-17. CAN Standard Compliant Bit Time Segment Settings

| Time Segment 1 | Time Segment 2 | Re-synchronization Jump Width |
|----------------|----------------|-------------------------------|
| 5 .. 10 | 2 | 1 .. 2 |
| 4 .. 11 | 3 | 1 .. 3 |
| 5 .. 12 | 4 | 1 .. 4 |
| 6 .. 13 | 5 | 1 .. 4 |
| 7 .. 14 | 6 | 1 .. 4 |
| 8 .. 15 | 7 | 1 .. 4 |
| 9 .. 16 | 8 | 1 .. 4 |

26.6.9.5 Arbitration and Matching Timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

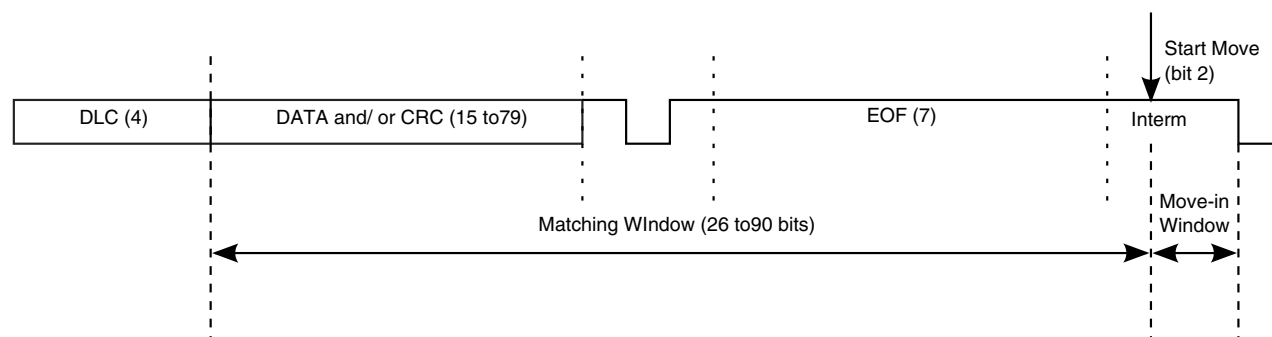

Figure 26-3. Matching and Move-In Time Windows

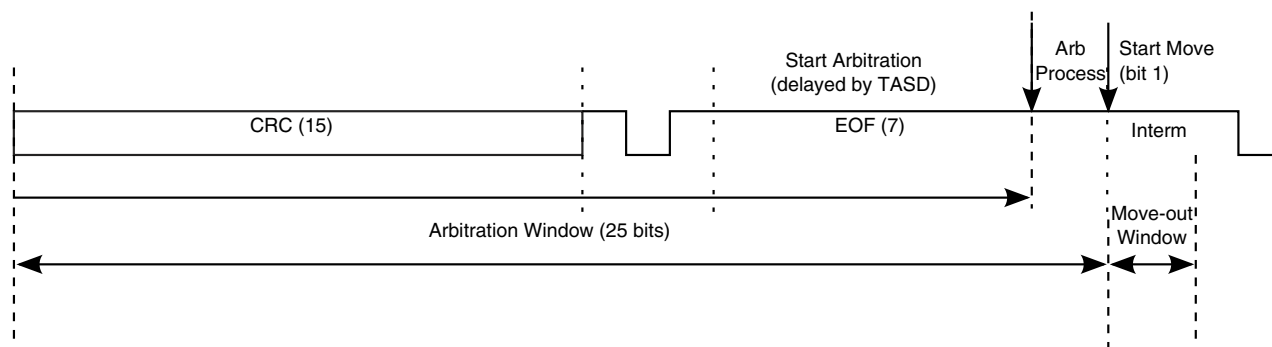

Figure 26-4. Arbitration and Move-Out Time Windows

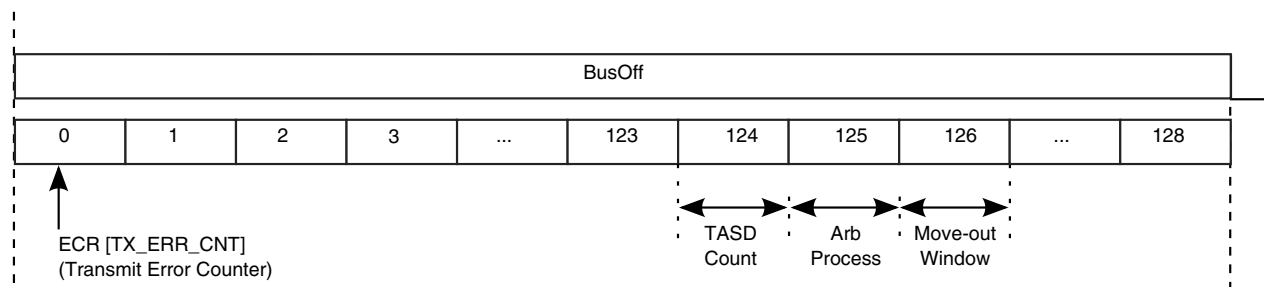

Figure 26-5. Arbitration at the end of Bus Off and Move-Out Time Windows

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in [Table 26-17](#)
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

Table 26-18. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate

| Number of Message Buffers | RFEN | Minimum Number of Peripheral Clocks per CAN bit |
|---------------------------|------|---|
| 16 and 32 | 0 | 16 |
| 64 | 0 | 25 |
| 16 | 1 | 16 |
| 32 | 1 | 17 |
| 64 | 1 | 30 |

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in [Table 26-18](#) can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRES DIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRES DIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

26.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode).

See in [Modes of Operation](#) an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

26.6.10.1 Freeze Mode

This mode is requested by ARM through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode . In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ_ACK bit in the same register. The ARM must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN_RX input pin and drives the FLEXCAN_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT_RDY and FRZ_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- ARM negates the FRZ bit in the MCR Register
- The ARM is removed from Debug Mode and the HALT bit is negated

The FRZ_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

26.6.10.2 Module Disable Mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the ARM through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM_ACK bit in the same register. The ARM must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM_ACK bit and negates the FRZ_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive

- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT_RDY and LPM_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the ARM to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the ARM. Exiting from this mode is done by negating the MDIS bit by ARM, which make FlexCAN requests to resume the clocks and negates the LPM_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by ARM.

26.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings.. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1_STOP_REQ and CAN2_STOP_REQ bit in the register IOMUXC_GPR13) and check the acknowledgement asserted by the FlexCAN (see the CAN1_STOP_ARX and CAN2_STOP_ARX in the register IOMUXC_GPR4) . The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM_ACK bit, negates the FRZ_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive
- Sets the NOT_RDY and LPM_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- ARM resuming the clocks and removing the Stop Mode request
- ARM resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK_INT bit in the ESR Register and, if enabled by the WAK_MSK bit in MCR, generates a Wake Up interrupt to the ARM. Upon receiving the interrupt, the ARM should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN_RX input line while in Stop Mode. See the WAK_SRC bit in [Module Configuration Register \(FLEXCAN_MCR\)](#) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments.

26.6.11 Interrupts

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the ARM writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See [Interrupt Flags 1 Register \(FLEXCAN_IFLAG1\)](#) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The ARM must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up) generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

26.7 Initialization/Application Information

This section provides instructions for initializing the FLEXCAN module.

26.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ_ACK and NOT_RDY bits in the MCR Register are set. The FLEXCAN_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
 - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
 - Enable the warning interrupts by setting the WRN_EN bit

- If required, disable frame self reception by setting the SRX_DIS bit
- Enable the FIFO by setting the RFEN bit
- Enable the abort mechanism by setting the AEN bit
- Enable the local priority feature by setting the LPRIO_EN bit
- Initialize the Control Register
 - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
 - Determine the bit rate by programming the PRESDIV field
 - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
 - The Control and Status word of all Message Buffers must be initialized
 - If FIFO was enabled, the 8-entry ID table must be initialized
 - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

26.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

FLEXCAN memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 209_0000 | Module Configuration Register (FLEXCAN1_MCR) | 32 | R/W | 5980_000Fh | 26.8.1/1306 |
| 209_0004 | Control 1 Register (FLEXCAN1_CTRL1) | 32 | R/W | 0000_0000h | 26.8.2/1311 |
| 209_0008 | Free Running Timer Register (FLEXCAN1_TIMER) | 32 | R/W | 0000_0000h | 26.8.3/1314 |

Table continues on the next page...

FLEXCAN memory map (continued)

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|-------------------------------|--|------------------------|---------------|--------------------|------------------------------|
| 209_0010 | Rx Mailboxes Global Mask Register (FLEXCAN1_RXMGMASK) | 32 | R/W | FFFF_FFFFh | 26.8.4/1315 |

FLEXCANx_MCR field descriptions

| Field | Description |
|----------------|---|
| 31 MDIS | <p>This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See Module Disable Mode for more information.</p> <p>1 Disable the FLEXCAN module 0 Enable the FLEXCAN module</p> |
| 30 FRZ | <p>The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at ARM level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode.</p> <p>1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode</p> |
| 29 RFEN | <p>This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 26-18 (see Arbitration and Matching Timing). This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FIFO enabled 0 FIFO not enabled</p> |
| 28 HALT | <p>Assertion of this bit puts the FLEXCAN module into Freeze Mode. The ARM should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes. See Freeze Mode for more information.</p> <p>1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.</p> |
| 27 NOT_RDY | <p>This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes.</p> <p>1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode</p> |
| 26 WAK_MSK | <p>This bit enables the Wake Up Interrupt generation.</p> <p>1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled</p> |
| 25 SOFT_RST | <p>When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers.</p> <p>The SOFT_RST bit can be asserted directly by the ARM when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.</p> <p>Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.</p> |

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

| Field | Description |
|---------------|--|
| | 1 Reset the registers 0 No reset request |
| 24 FRZ_ACK | This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See Freeze Mode for more information 1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running |
| 23 SUPV | This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses |
| 22 SLF_WAK | This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the ARM so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode. 1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled |
| 21 WRN_EN | When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <96 to ≥ 96. 0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters. |
| 20 LPM_ACK | This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the ARM can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See Module Disable Mode , and Stop Mode for more information 1 FLEXCAN is either in Disable Mode, or Stop mode 0 FLEXCAN not in any of the low power modes |
| 19 WAK_SRC | This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See Stop Mode for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus 0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus. |
| 18 - | This field is reserved. Reserved |

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

| Field | Description |
|----------------|---|
| 17 SRX_DIS | <p>This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Self reception disabled 0 Self reception enabled</p> |
| 16 IRMQ | <p>This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Individual Rx masking and queue feature are enabled. 0 Individual Rx masking and queue feature are disabled. For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.</p> |
| 15–14 - | This field is reserved. Reserved |
| 13 LPRIQ_EN | <p>This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Local Priority enabled 0 Local Priority disabled</p> |
| 12 AEN | <p>This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted.</p> <p>1 Abort enabled 0 Abort disabled</p> |
| 11–10 - | This field is reserved. Reserved |
| 9–8 IDAM | <p>This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See Rx FIFO Structure. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.</p> |
| 7 - | This field is reserved. Reserved |
| 6–0 MAXMB | <p>This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes</p> <p>Number of the last MB = MAXMB.</p> |

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

| Field | Description |
|-------|---|
| | NOTE: Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN] MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 26-18 (see Arbitration and Matching Timing). |

26.8.3 Control 1 Register (FLEXCANx_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

FLEXCANx_CTRL1 field descriptions

| Field | Description |
|------------------|---|
| 31–24 PRESDIV | This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. For more information refer to Protocol Timing . This field can only be written in Freeze mode as it is blocked by hardware in other modes. |

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

| Field | Description |
|----------------|---|
| | Sclock frequency = CPI clock frequency / (PRESDIV+1) |
| 23–22 RJW | This 2-bit field defines the maximum number of time quanta that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes Resync Jump Width = RJW + 1. |
| 21–19 PSEG1 | This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta. |
| 18–16 PSEG2 | This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta. |
| 15 BOFF_MSK | This bit provides a mask for the Bus Off Interrupt. 1 Bus Off interrupt enabled 0 Bus Off interrupt disabled |
| 14 ERR_MSK | This bit provides a mask for the Error Interrupt. 1 Error interrupt enabled 0 Error interrupt disabled |
| 13 - | This field is reserved. Reserved |
| 12 LPB | This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Loop Back enabled 0 Loop Back disabled |
| 11 TWRN_MSK | This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled |
| 10 RWRN_MSK | This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled |
| 9–8 - | This field is reserved. Reserved |
| 7 SMP | This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. |

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

| Field | Description |
|-----------------|--|
| | <p>1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used</p> <p>0 Just one sample is used to determine the bit value</p> |
| 6 BOFF_REC | <p>This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery.</p> <p>1 Automatic recovering from Bus Off state disabled</p> <p>0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B</p> |
| 5 TSYN | <p>This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Timer Sync feature enabled</p> <p>0 Timer Sync feature disabled</p> |
| 4 LBUF | <p>This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Lowest number buffer is transmitted first</p> <p>0 Buffer with highest priority is transmitted first</p> |
| 3 LOM | <p>This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.</p> <p>Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN module operates in Listen Only Mode</p> <p>0 Listen Only Mode is deactivated</p> |
| 2-0 PROP_SEG | <p>This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes</p> <p>Propagation Segment Time = (PROPSEG + 1) * Time-Quanta.</p> <p>Time-Quantum = one Sclock period.</p> |

1. One time quantum is equal to the Sclock period.

26.8.4 Free Running Timer Register (FLEXCANx_TIMER)

This register represents a 16-bit free running counter that can be read and written by the ARM. The timer starts from \$0000 after Reset, counts linearly to \$FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

Address: Base address + 8h offset

26.8.5 Rx Mailboxes Global Mask Register (FLEXCANx_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Table 26-49. Rx Mailboxes Global Mask usage

| SMB[RTR] ¹ | CTRL2[RRS] | CTRL2[EACEN] | Mailbox filter fields | | | |

| | are located in the Control and Status word of the Mailbox. Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK) shows in detail which MG bits mask each Mailbox filter field. |
| 1 | The corresponding bit in the filter is checked against the one received |
| 0 | the corresponding bit in the filter is "don't care" |

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

26.8.6 Rx Buffer 14 Mask Register (FLEXCANx_RX14MASK)

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

26.8.8 Error Counter Register (FLEXCANx_ECR)

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx_Err_Counter field) and Receive Error Counter (Rx_Err_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx_Err_Counter or Rx_Err_Counter increases to be greater than or equal to 128, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx_Err_Counter or Rx_Err_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx_Err_Counter increases to be greater than 255, the FLT_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx_Err_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx_Err_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx_Err_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx_Err_Counter. When Tx_Err_Counter reaches the value of 128, the FLT_CONF field in the Error and Status Register is updated to be 'Error Active' and

both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx_Err_Counter value.

- If during system start-up, only one node is operating, then its Tx_Err_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx_Err_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx_Err_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

26.8.9 Error and Status 1 Register (FLEXCANx_ESR1)

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.

The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits.

Some bits in this register are read-only and some are not.

| Field | Description |
|----------------|--|
| 17 TWRN_INT | <p>If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode.</p> <p>1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence</p> |
| 16 RWRN_INT | <p>If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.</p> <p>1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence</p> |
| 15 BIT1_ERR | <p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.</p> <p>1 At least one bit sent as recessive is received as dominant 0 No such occurrence</p> |
| 14 BIT0_ERR | <p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>1 At least one bit sent as dominant is received as recessive 0 No such occurrence</p> |
| 13 ACK_ERR | <p>This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.</p> <p>1 An ACK error occurred since last read of this register 0 No such occurrence</p> |
| 12 CRC_ERR | <p>This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.</p> <p>1 A CRC error occurred since last read of this register. 0 No such occurrence</p> |
| 11 FRM_ERR | <p>This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.</p> <p>1 A Form Error occurred since last read of this register 0 No such occurrence</p> |
| 10 STF_ERR | <p>This bit indicates that a Stuffing Error has been detected.</p> <p>1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.</p> |
| 9 TX_WRN | <p>This bit indicates when repetitive errors are occurring during message transmission.</p> |

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

| Field | Description |
|-----------------|--|
| | 1 TX_Err_Counter \geq 96 0 No such occurrence |
| 8 RX_WRN | This bit indicates when repetitive errors are occurring during message reception. 1 Rx_Err_Counter \geq 96 0 No such occurrence |
| 7 IDLE | This bit indicates when CAN bus is in IDLE state. Refer to Table 26-29 . 1 CAN bus is now IDLE 0 No such occurrence |
| 6 TX | This bit indicates if FLEXCAN is transmitting a message. Refer to Table 26-29 . 1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message |
| 5–4 FLT_CONF | If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again. Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted. This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below: 00 Error Active 01 Error Passive 1x Bus off |
| 3 RX | This bit indicates if FlexCAN is receiving a message. Refer to Table 26-29 . 1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message |
| 2 BOFF_INT | This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect. 1 FLEXCAN module entered 'Bus Off' state 0 No such occurrence |
| 1 ERR_INT | This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect. 1 Indicates setting of any Error Bit in the Error and Status Register 0 No such occurrence |
| 0 WAK_INT | When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect 1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode 0 No such occurrence |

26.8.10 Interrupt Masks 2 Register (FLEXCANx_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

FLEXCANx_IFLAG2 field descriptions

| Field | Description |
|-----------------------|---|
| 31–0 BUF63I_BUF32I | Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt. 1 The corresponding buffer has successfully completed transmission or reception 0 No such occurrence |

26.8.13 Interrupt Flags 1 Register (FLEXCANx_IFLAG1)

This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAG1 asserted

in the Rx FIFO region (see [Rx FIFO](#)). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

FLEXCANx_IFLAG1 field descriptions

| Field | Description |
|----------------------|---|
| 31–8 BUF31I_BUF8I | Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt. 1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence |
| 7 BUF7I | If the Rx FIFO is not enabled, this bit flags the interrupt for MB7. If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence |
| 6 BUF6I | If the Rx FIFO is not enabled, this bit flags the interrupt for MB6. If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. |

Table continues on the next page...

FLEXCANx_IFLAG1 field descriptions (continued)

| Field | Description |
|--------------------|---|
| | 1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence |
| 5 BUF5I | If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence |
| 4–0 BUF4I_BUF0I | If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4. If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations. These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 Corresponding MB completed transmission/reception 0 No such occurrence |

26.8.14 Control 2 Register (FLEXCANx_CTRL2)

This register contains control bits for CAN errors, FIFO features and mode selection.

Table 26-60. Rx FIFO Filters

| RFFN[3:0] | Number of Rx FIFO filters | Message Buffers occupied by Rx FIFO and ID Filter Table | Remaining Available Mailboxes ¹ | Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks ² | Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask ² |

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP_MB} - 6) \times 4$$

where SETUP_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 26-36](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

FLEXCANx_CTRL2 field descriptions

| Field | Description |
|---------------|---|
| 31 - | must be written as 0 |
| 30–29 - | This field is reserved. Reserved |
| 28 WRMFRZ | Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode. 1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory |
| 27–24 RFEN | This 4-bit field defines the number of Rx FIFO filters according to Table 26-35 . The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see Table 26-35) that may not exceed the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see Module Configuration Register (FLEXCAN_MCR)) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 26-18 (see Arbitration and Matching Timing). |
| 23–19 TASD | This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes. This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency. The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa. If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration. If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted. The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate. The optimal configuration for TASD can be calculated as: |

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

| Field | Description |
|-------------|--|
| | $TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{SYS} \times [1 + (PSEG1 + 1) + (PSEG2 + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p>f_{CANCLK} is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. | 18 MRP | <p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p> |
| 17 RRS | <p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p> |
| 16 EACEN | <p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p> |

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

| Field | Description |
|-----------|-------------------------------------|
| 15–0 - | This field is reserved. Reserved |

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

26.8.15 Error and Status 2 Register (FLEXCANx_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

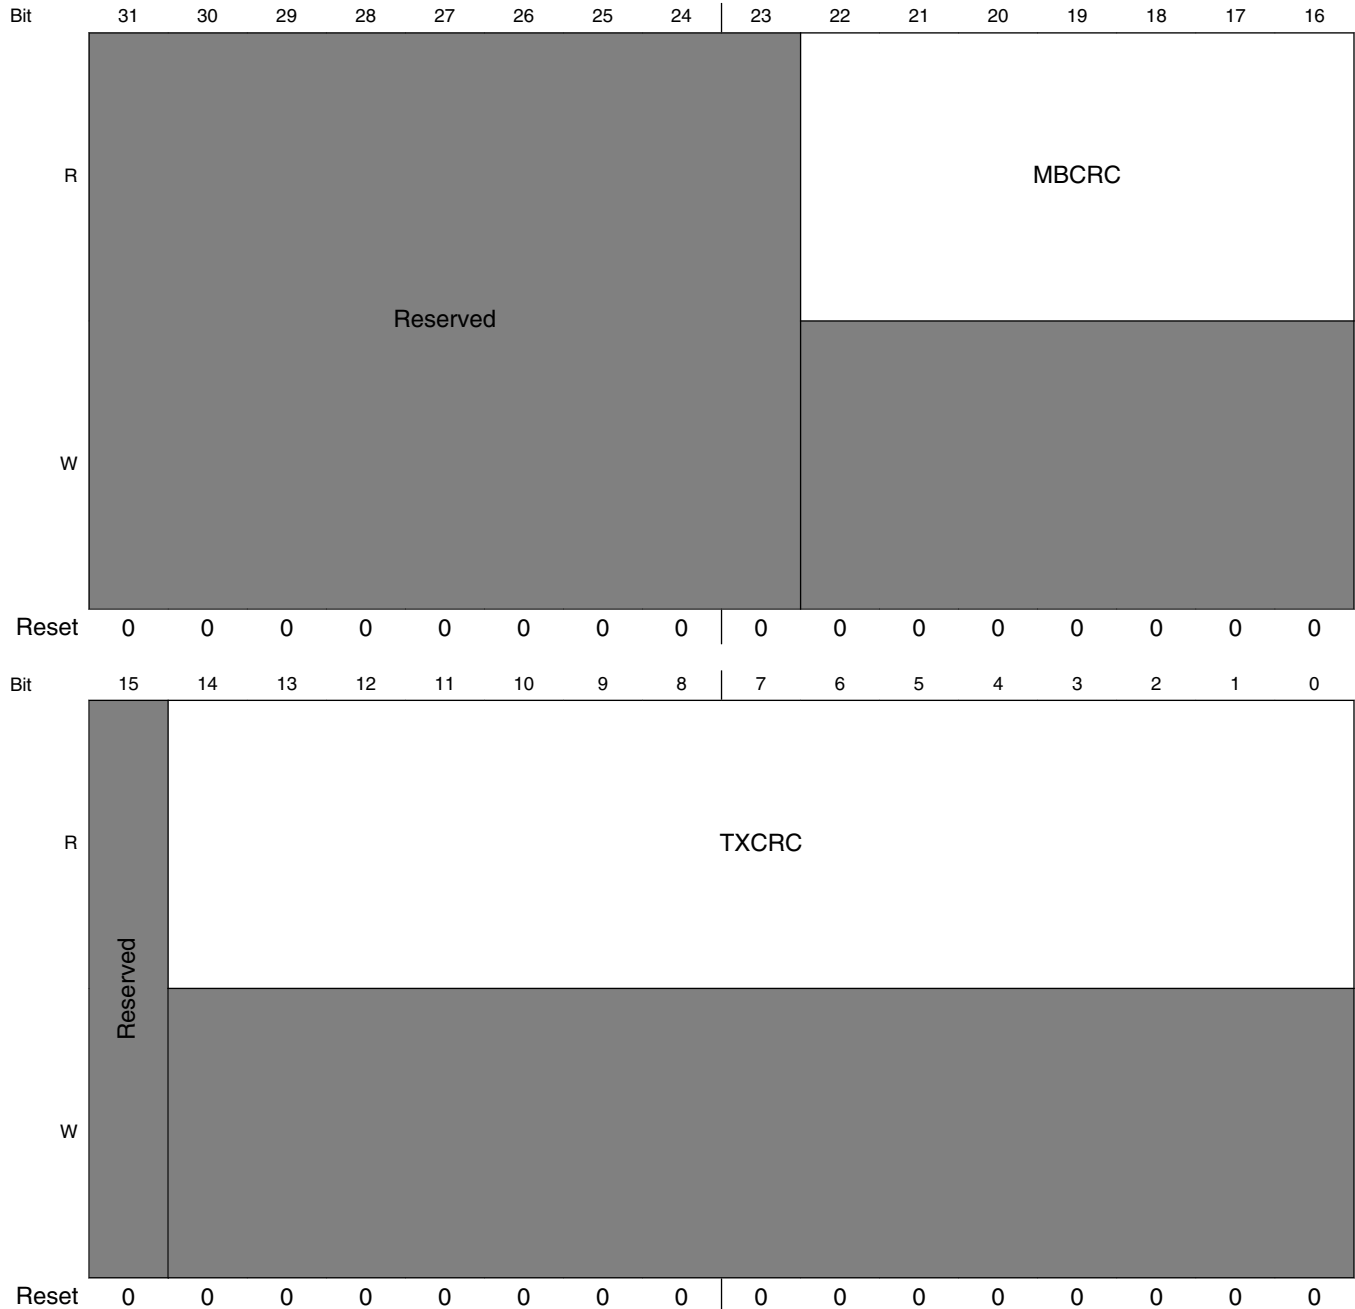

FLEXCANx_ESR2 field descriptions

| Field | Description |
|---------------|---|
| 31–23 - | This field is reserved. Reserved |
| 22–16 LPTM | If ESR2[VPS] is asserted, this 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see Highest Mailbox priority first). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number. |
| 15 - | This field is reserved. Reserved |
| 14 VPS | This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid |
| 13 IMB | If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000). This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see Arbitration process). LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox. |
| 12–0 - | This field is reserved. Reserved |

26.8.16 CRC Register (FLEXCANx_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

FLEXCANx_CRCR field descriptions

| Field | Description |
|----------------|---|
| 31–23 - | This field is reserved. Reserved |
| 22–16 MBCRC | This field indicates the number of the Mailbox corresponding to the value in TXCRC field. |
| 15 - | This field is reserved. Reserved |
| 14–0 TXCRC | This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted. |

26.8.17 Rx FIFO Global Mask Register (FLEXCANx_RXFGMASK)

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

Table 26-65. Rx FIFO Global Mask usage

| Rx FIFO ID Filter Table Elements Format (MCR[IDAM]) | Identifier Acceptance Filter fields | | | | | |
|--|-------------------------------------|--------------------|-----------|---|---|----------|
| | RTR | IDE | RXIDA | RXIDB | RXIDC | reserved |
| A | FGM[31] | FGM[30] | FGM[29:1] | - | - | FGM[0] |
| B | FGM[31] FGM[15] | FGM[30] FGM[14] | - | FGM[29:16] FGM[13:0] ¹ | - | - |
| C | - | - | - | - | FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] ² | - |

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

- If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

Address: Base address + 48h offset

FLEXCANx_RXFGMASK field descriptions

| Field | Description |
|--------------------|--|
| 31–0 FGM31_FGM0 | These bits mask the ID Filter Table elements bits in a perfect alignment. Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK) shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter. 1 The corresponding bit in the filter is checked 0 The corresponding bit in the filter is "don't care" |

- If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
- If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

26.8.18 Rx FIFO Information Register (FLEXCANx_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

FLEXCANx_RXFIR field descriptions

| Field | Description |
|--------------|---|
| 31–9 - | This field is reserved. Reserved |
| 8–0 IDHIT | This 9-bit field indicates which Identifier Acceptance Filter (see Rx FIFO Structure) was hit by the received message that is in the output of the Rx FIFO. (refer to Rx FIFO for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted. |

26.8.19 Rx Individual Mask Registers (FLEXCANx_RXIMR0_RXIMR63)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN_CTRL2\)](#) for details.

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

|------------------|---|
| 31–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7–0 GFWR | It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33us when the oscillator is 24MHz. |

Chapter 27

General Power Controller (GPC)

27.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- [DVFS - Dynamic Voltage & Frequency Scaling](#) load tracking for multi-core CPU
- [CPU Power Gating Control \(PGC\)](#)
- GPU/VPU accelerators power gating controller

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

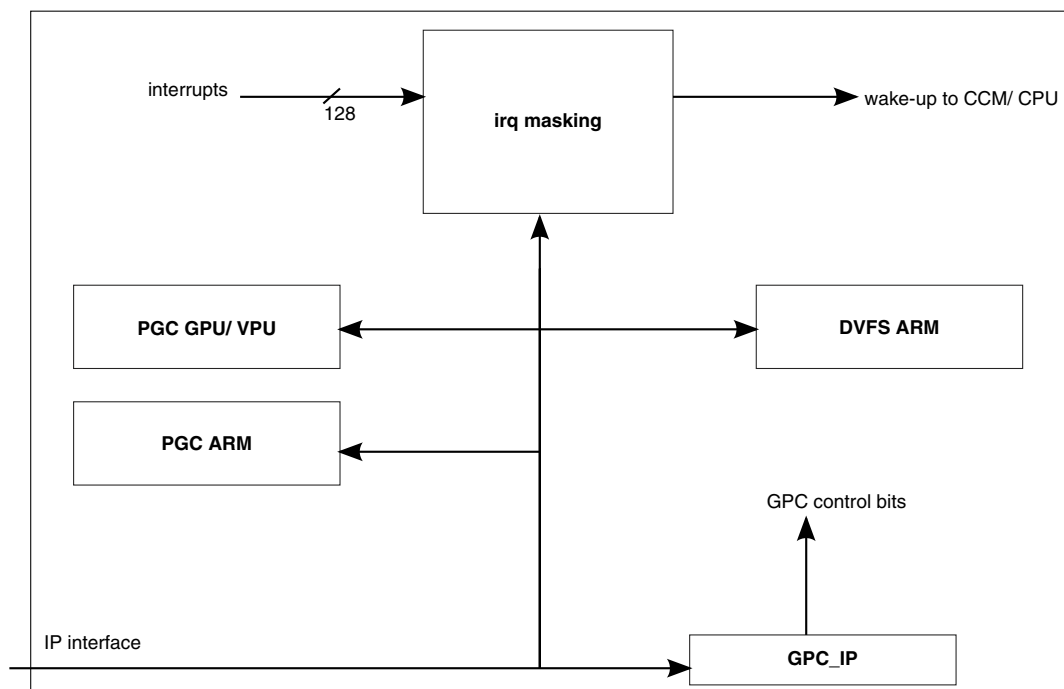

Figure 27-1. GPC Block Diagram

27.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 27-1. GPC Clocks

| Clock name | Clock Root | Description |
|------------|--------------|-------------------------|
| ipg_clk | ipg_clk_root | Peripheral clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |
| pgc_clk | ipg_clk_root | PGC peripheral clock |
| sys_clk | ipg_clk_root | Module clock |

27.3 DVFS overview

The DVFS allows simple dynamic voltage frequency scaling.

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporally switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

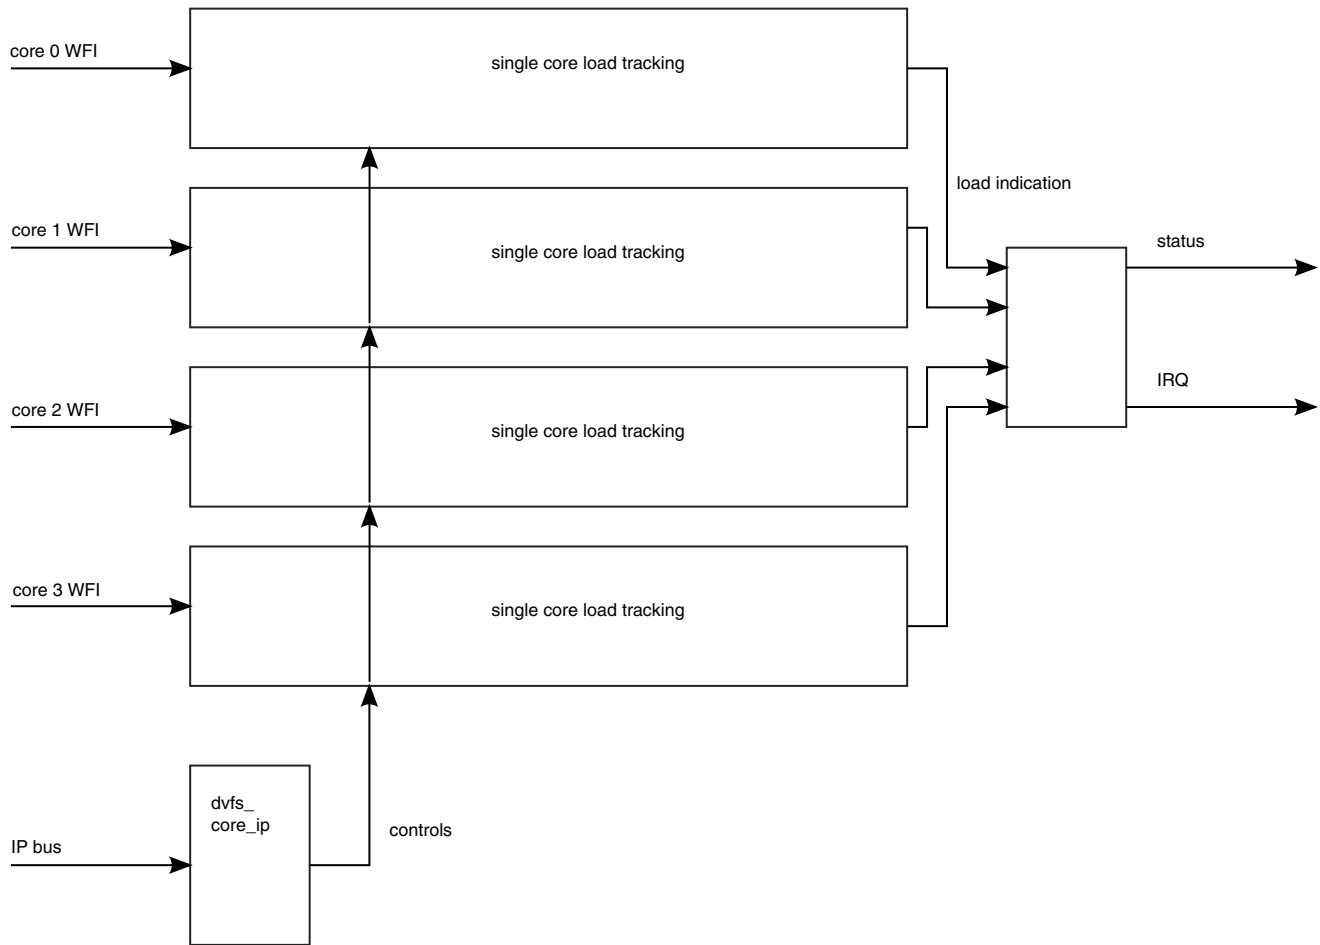

Figure 27-2. DVFS_core diagram

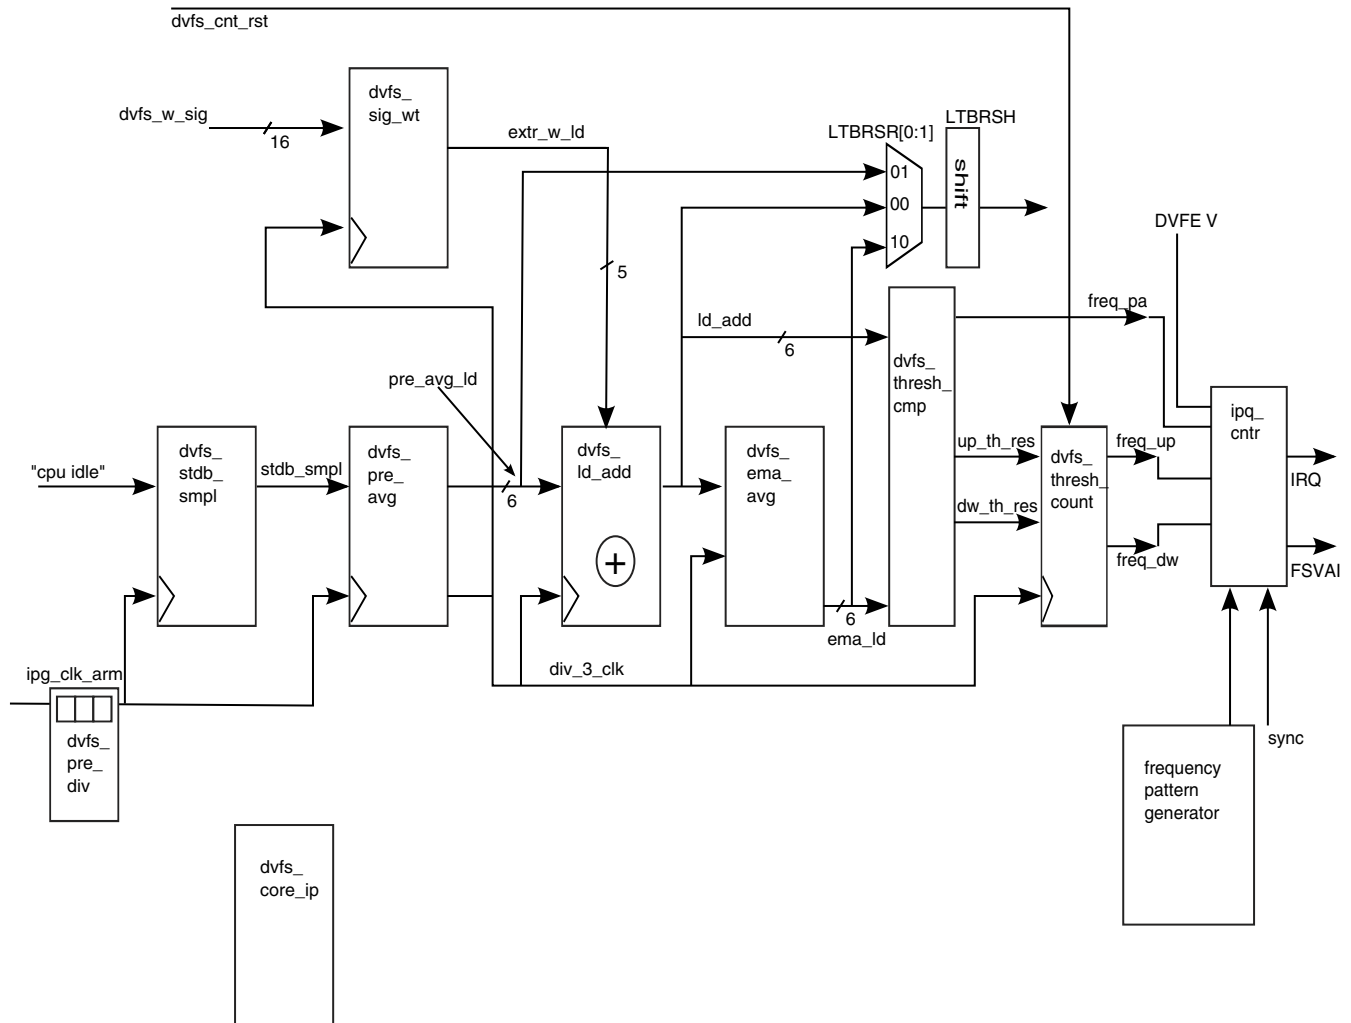

Figure 27-3. DVFS_core: single core load tracking module

27.3.1 Features

The DVFS load tracking block includes the following features:

- Configurable include/exclude of input signals:
 - per-core ARM standby signal (idle / non-idle)
 - 16 general purpose bits (common for all 4 tracking modules)
 - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

27.4 Component Blocks description

27.4.1 dvfs_stdb_smpl block

This block samples the `ccm_arm_stdb` signal (ARM STANDBYWFI signal - idle state indicating) according to the edge of the `ipg_clk_arm` (ARM system clock) signal.

Figure 27-4. dvfs_stdb_smpl block diagram

This block synchronizes the `ccm_arm_stdb` signal with the `ipg_clk_arm` clock. The two signals enter the flip-flops twice and become synchronized. The resulting synchronized signal is `stdb_smpl`.

27.4.2 dvfs_sig_wt block

The purpose of this block is to sample the 16 GeP (general purpose) load signals, multiply each one of them by appropriate weight and sum products.

The sampling is done by the slow clock div_3_clk.

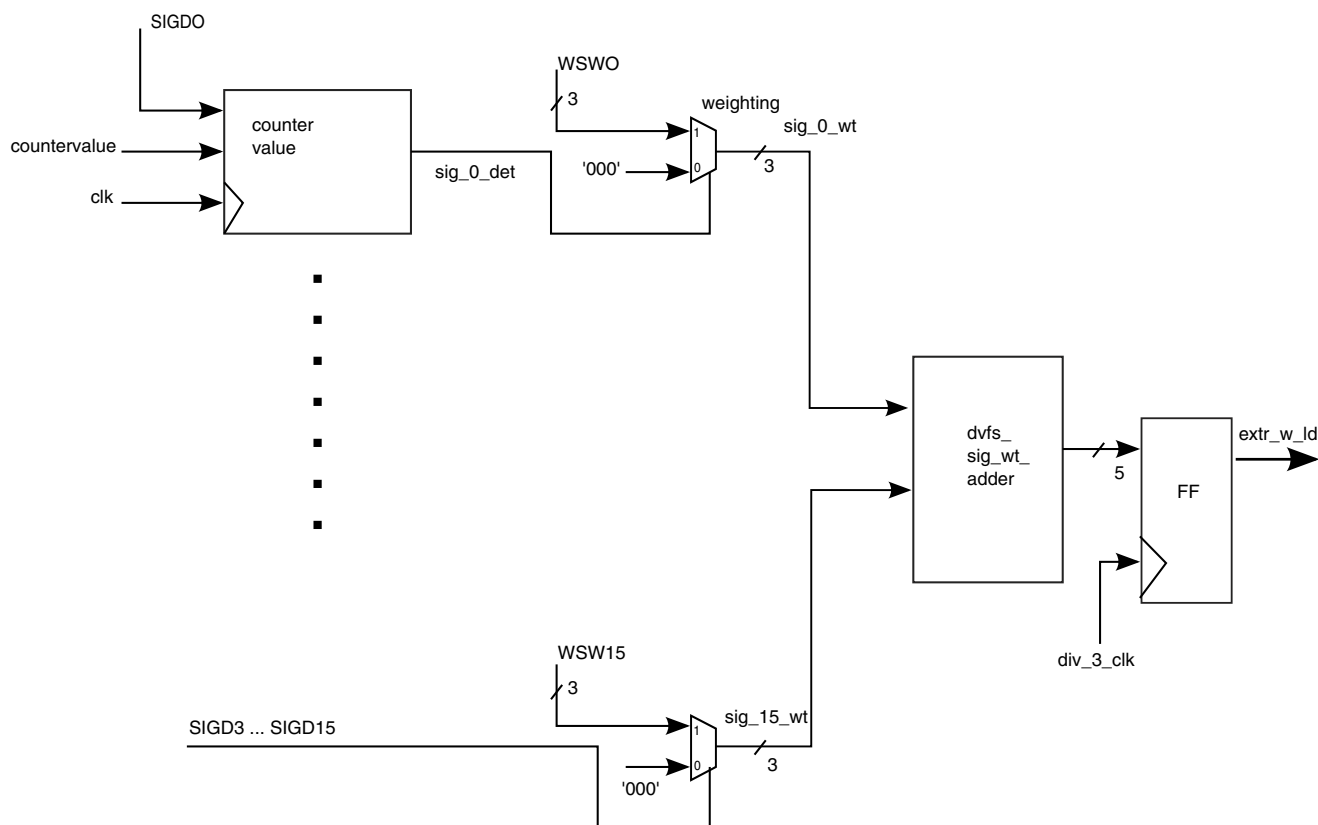

Figure 27-5. dvfs_sig_wt block diagram

27.4.3 dvfs_pre_avg block

The purpose of the dvfs_pre_avg block is to perform simple, non-overlapping averaging, reducing the sampling clock frequency and providing a level-based average index of the tracked CPU load.

External signals:

- stdb_sampl - (input) sampled ARM standby signal
- ipg_clk_arm - (input) ARM system clk
- pre_avg_ld[4..0] - (output) averaged load
- div_3_clk - (output) clock, generated (reduced) from div_2_clk

- In the current implementation, the averaging is performed in three stages:

- The output 5 bits avg_load signal provides a result with a tolerance of ~3%. The supported values range is 0-0.97.

dvfs_pre_avg clocks**Figure 27-7. dvfs_pre_avg clocks**

The internal clocks in **dvfs_avg_pre** block are generated from **ipg_clk_arm**. The details are in the tables below. For **div_3_clk** averaging, see [DVFS Control \(DVFSC_CNTR\)](#) for more information.

Table 27-2. dvfs_pre_avg signals and its values

| signal | binary max value | binary min value | decimal max value | decimal min value |
|--------------|--------------------|--------------------|-------------------|-------------------|
| sum_2 | 11111 | 0000 | 31 | 0 |
| sum_3 | 111'1100'0000'0000 | 000'0000'0000'0000 | 31744 | 0 |
| pre_avg_load | 11111 | 0000 | 31 | 0 |

Table 27-3. dvfs_pre_avg generated clocks

| clock name | generated from | ratio to source | ratio to ipg_clk_arm | max clk freq. | note |
|----------------------|----------------|-----------------|----------------------|---------------|--------------|
| ipg_clk_arm | N/A | N/A | 1 | 66MHz | source clock |
| div_1_clk | ipg_clk_arm | configurable | configurable | 66MHz | configurable |
| div_2_clk (gated) | div_1_clk | 512 | configurable | 128KHz | none |
| div_3_clk (gated) | div_2_clk | configurable | configurable | 128KHz | configurable |

27.4.4 dvfs_ld_add block

The dvfs_ld_add block sums the CPU load tracked by idle/non-idle signal slot, and the load detected from the additional load signals weighted by dvfs_sig_wt block.

The adder should perform the following operation:

$$\text{extr_w_ld}[4..0] + \{0, \text{pre_avg_ld}[4..0]\}$$

The input signals of five bits produce output signal of six bits, providing 3% resolution in the range of 0-1.97 of load indication. (1 is equal to 100% load tracking with no additional signals include.)

The output ld_add[5..0] is sampled by div_3_clk signal.

Figure 27-8. dvfs_ld_add block diagram

27.4.5 dvfs_ema_avg block

The purpose of dvfs_ema_avg (EMA - Exponential Moving Average) block is to calculate an exponential moving average of the tracked CPU load.

The parameters of EMA are defined by EMAC bits in DVFSEMAC. These parameters set how many samples of simple average will be taken into account.

The EMA formula is: $\text{EMA}(i) = a \cdot X(i) + (1-a) \cdot \text{EMA}(i-1)$

where:

$$a = 2 / (N+1);$$

N is the number of samples taken into account.

X(i) = current input sample;

$EMA(i-1)$ = previous value of EMA.

By setting the value of "a", the behavior of EMA is defined.

In the following table, the parameter "a" is listed relatively to the amount of the X(i) samples taken into account ("N") in the equation above: (the resolution of the digital multiplier is limited, hence the lowest values of the "a" can be linked to a range of included samples in EMA instead of single number).

The following table also contains the amount of cycles in which the lower frequency will be masked from the moment that DVFS is enabled (and not between frequency switches), so that enough information about the history can be gained before the frequency is lowered.

Table 27-4. EMA settings

| samples included in EMA calculatio n (N) | Number of cycles while lower frequency interrupt is masked | "a" value (decimal) | "a" value, adjusted by binary resolution | "a" value (binary) | | | | | | | | |
|--|--|------------------------|---|--------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| | | | | bit 0 | bit 1 | bit 2 | bit 3 | bit 4 | bit 5 | bit 6 | bit 7 | bit 8 |
| ----- | | ----- | ----- | | | | | | | | | |

dvfs_ema_avg block diagram

Figure 27-9. dvfs_ema_avg block diagram

The EMA block inputs are as follows:

- **ld_add[5..0]** - load level
- **EMACFG[8..0]** - "a" parameter of EMA algorithm
- **div_2_clk** - fast clock, not shown this in the diagram
- **div_3_clk** - slow clock

The EMA block outputs the following:

- **ema_ld[5..0]** - result of EMA algorithm (by **div_3_clk**)

The mult_a block multiplies between comp_load (6 bits) and EMACFG (9 bits). For the multiply operation, a faster clock (for internal sum) is required, which is provided by div_2_clk. Div_2_clk is faster than the div_3_clk by a factor of at least 16, which is enough for 6*9 or 9*6 operations. Only the highest six bits are taken from the result of mult_a.

The mult_b block operates in a similar manner.

The adder block's output is sampled with div_3_clk clock.

27.4.6 dvfs_thres_cmp block

The dvfs_thres_cmp block compares the CPU load value to programmable threshold levels.

The comparators as shown in the drawing below are used:

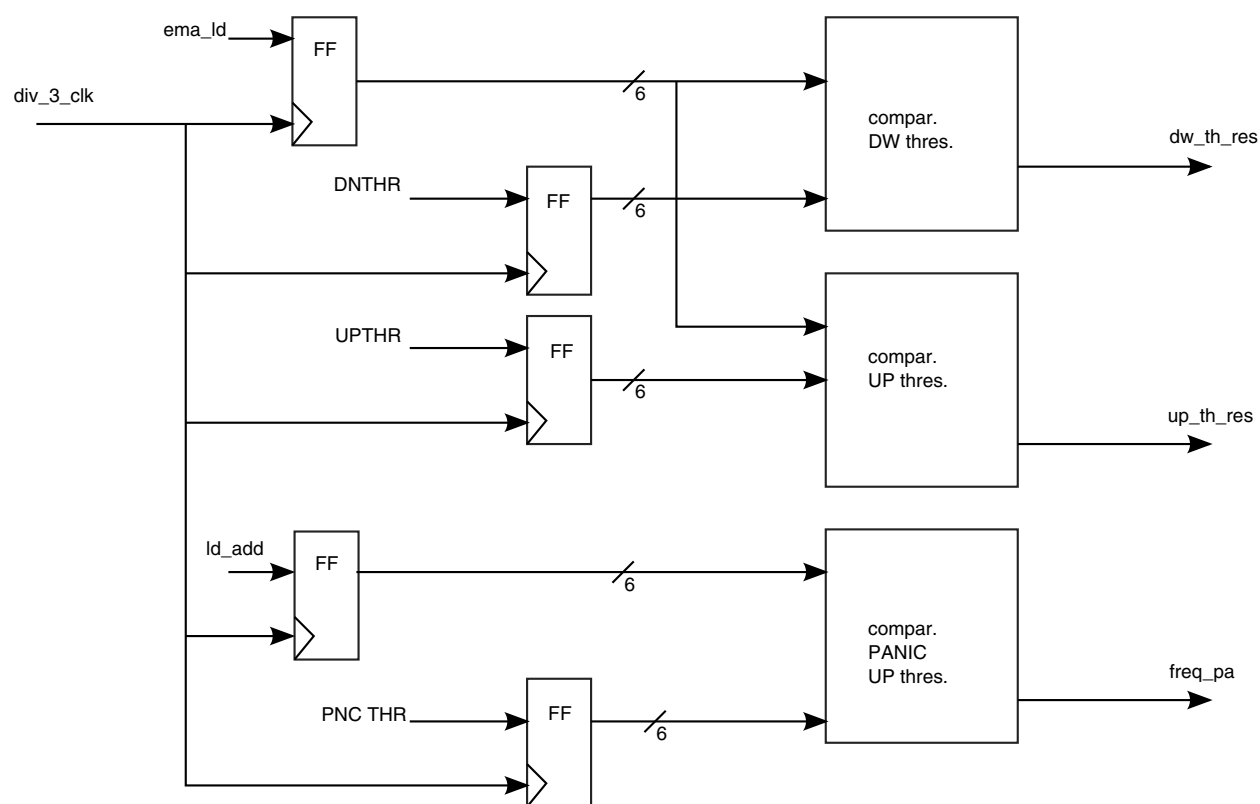

Figure 27-10. dvfs_tresh_cmp diagram

The block is composed of three (3) comparators:

1. compar_dw_thres comparator, which compares between ema_ld signal (output of EMA block) and DNTHR signal (taken from config register, bits DNTHR).

2. compar_up_thres comparator, which compares between ema_ld signal (output of EMA block) and UPTHR signal (taken from config register, bits UPTHR).
3. compar_panic_up_thres comparator, which compares between ld_add signal (output of load_adder block) and PNCTHR signal (taken from config register, bits PNCTHR).

NOTE

The current implementation of this block enables step-by-step down frequency change. For more advanced options, the number of the DW threshold comparators should be increased (up to three for four-level DVFS).

27.4.7 dvfs_thresh_count block

The purpose of the dvfs_thres_count block is to count consecutive threshold overcomes of dw_th_res and up_th_res (outputs of threshold_comp block).

If any of the counters (see the figure below) receives a null (zero) input synchronous with the clk3 signal, the counter is reset.

If the counter reaches a user defined value, its output is set to an active level. These counters are reset each time frequency scaling occurs or if the threshold overcomes are consecutive.

This block's output signals are saved in configuration register 0, bits [3,2].

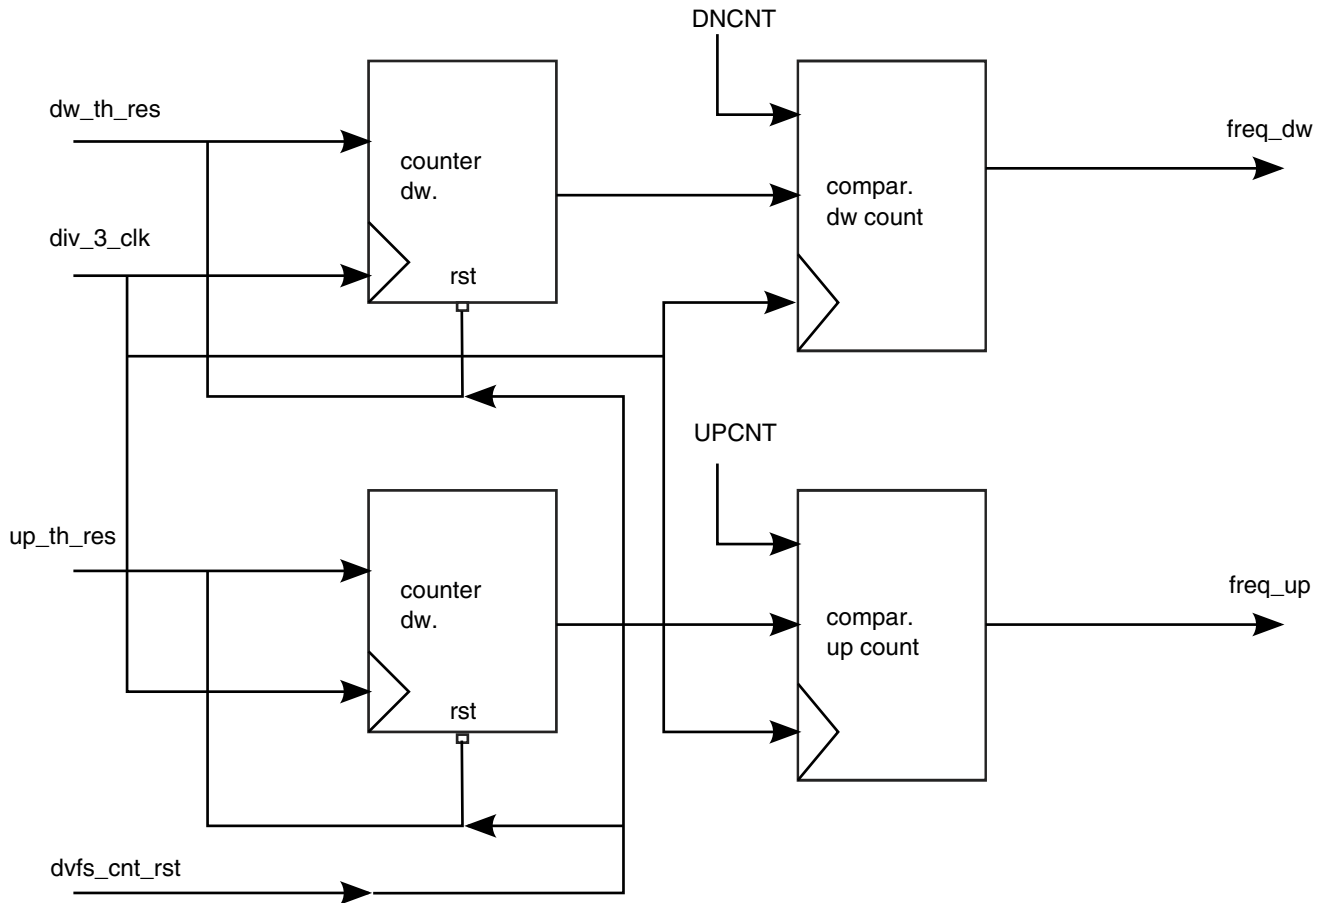

Figure 27-11. Thresh_counters block diagram

27.4.8 Load Tracking Buffer Register

The purpose of the load tracking buffer register is to save last 16 samples of the tracked load (before EMA operation).

Hence, the 4 bits of `ld_add` signal (depending on the `LTBRSH`) are saved continuously, overwriting each time the latest sample. Each save is carried upon detecting an edge of the `div_3_clk` signal.

27.4.9 Frequency Pattern Generator

Frequency pattern generator is able to manage the frequency update requests periodically, additionally to main frequency update requests (if bit `FPUE` is set).

The periodic requests are created following the `DVFSPT0`, `DVFSPT1`, `DVFSPT2` and `DVFSPT3` register values, as described in the figure below.

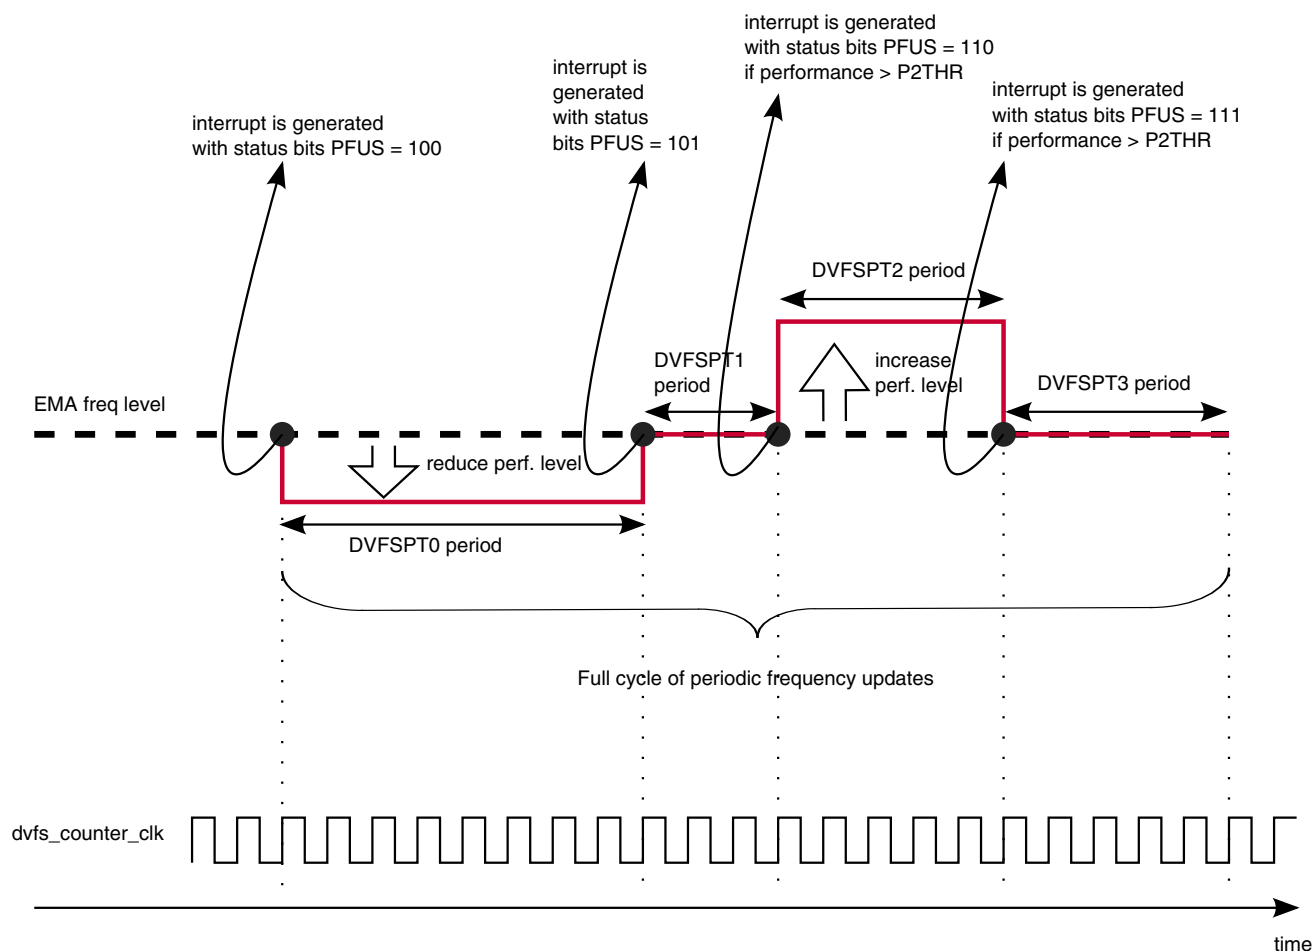

Figure 27-12. DVFS periodic frequency update requests

In case that one of the DVFSPT0-DVFSPT3 period is set to "0", such frequency update will be skipped.

The periodic frequency update status is reflected in PFUS bits (reduce/increase performance request is an example - the actual steps taken upon period expiration are defined by s/w routine).

Dvfs_counter_clk is ckih divided 64: $26\text{MHz}/64=0.40625\text{MHz}$. The DVFSPT0, DVFSPT1, DVFSPT2 and DVFSPT3 counter are selected for 17 bits each to provide delay of $2^{18}-1=262143$ counts, that are equal to 645ms. On the other hand, clk cycle of 0.40625MHz is $\sim 2.46\mu\text{s}$, that is fast enough to provide high resolution for frequency management for tasks.

The DVFSPT2 and DVFSPT3 interrupt generation is conditional upon current performance being greater than DVFSPT2[P2THR]. Otherwise the pattern delay will be counted, but without interrupt generation.

27.5 DVFS output event/interrupt configuration

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div_3_clk.

27.5.1 Interrupts

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

27.5.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

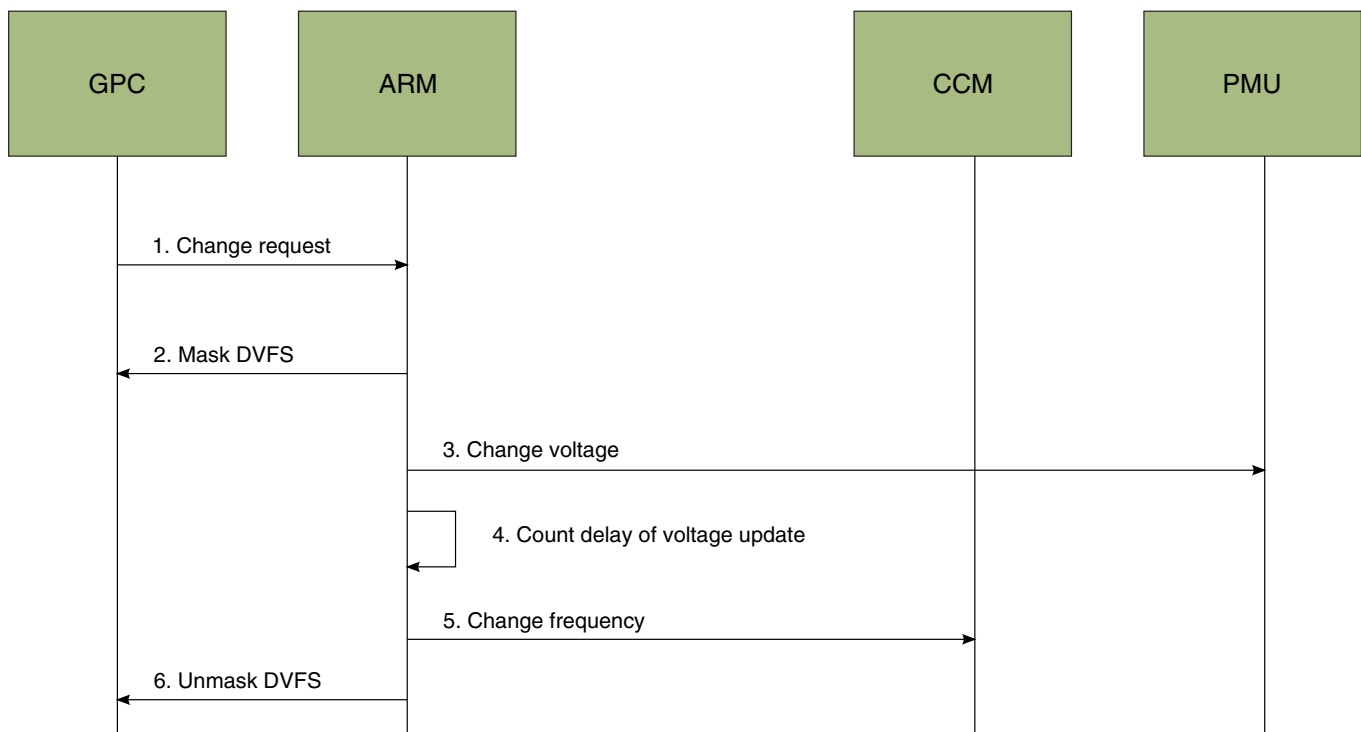

Figure 27-13. DVFS - frequency increase

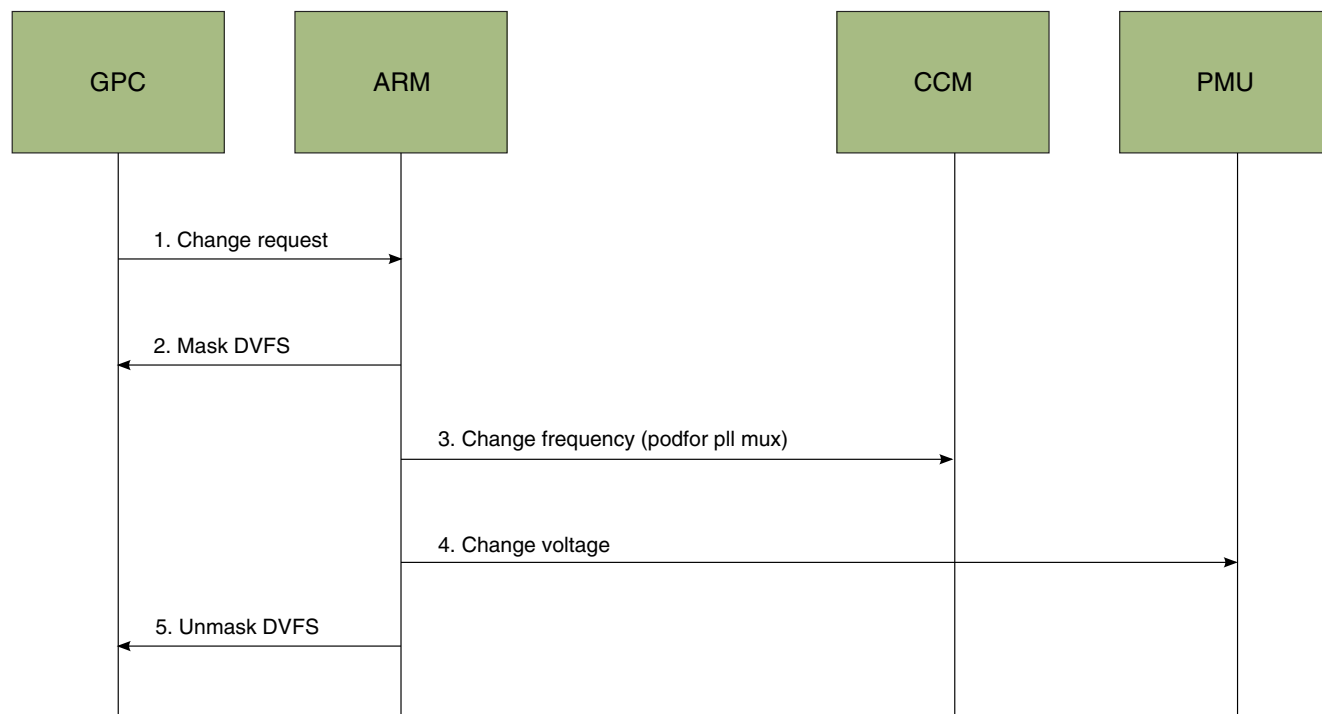

Figure 27-14. DVFS - frequency decrease

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

27.6 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

PGC power up sequence:

- One of the power up irq is asserted.

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

Figure 27-15. GPC-SRC handshake for reset after power gating

27.6.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 27-16](#) shows PGC as part of the SoC's overall power management scheme.

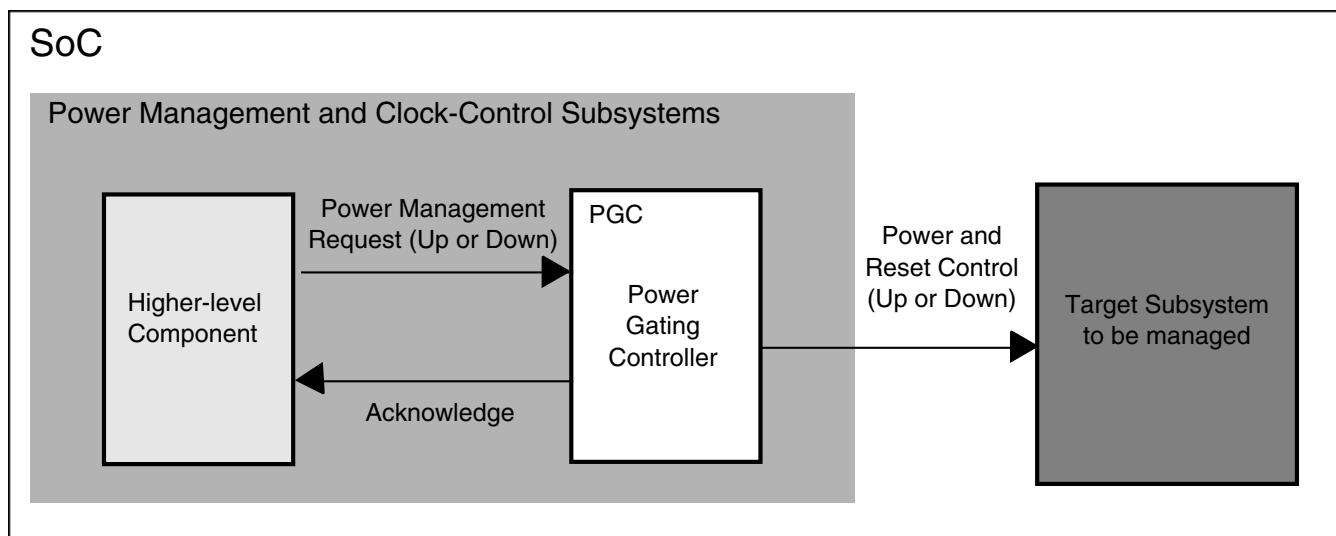

Figure 27-16. PGC Block Diagram

27.6.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

27.7 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

27.7.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

27.8 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

GPC memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |

27.9 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by [GPC base address] + [PGC CPU/GPU/DISPLAY Offset].

PGC memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 20D_C260 | PGC Control Register (PGC_GPU_CTRL) | 32 | R/W | 0000_0000h | 27.9.1/1367 |
| 20D_C264 | Power Up Sequence Control Register (PGC_GPU_PUPSCR) | 32 | R/W | 0000_0F01h | 27.9.2/1368 |

PGC_GPU_PUPSCR field descriptions

| Field | Description |
|-------------------|---|
| 31–14 Reserved | This read-only field is reserved and always has the value 0. |
| 13–8 SW2ISO | After asserting power toggle on/off signal (switch_b), the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation. NOTE: SW2ISO must not be programmed to zero. |
| 7–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5–0 SW | After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting power toggle on/off signal (switch_b). NOTE: SW must not be programmed to zero. NOTE: The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See Clock Controller Module (CCM) . |

27.9.3 Pull Down Sequence Control Register (PGC_GPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D_C000h base + 268h offset = 20D_C268h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|-----|----|---|---|---|---|---|---|---|---|---|---|
| R | 0 | | | | | | | | | | | | | | ISO2SW | | | | 0 | | ISO | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

PGC_GPU_PDNSCR field descriptions

| Field | Description |
|-------------------|--|
| 31–14 Reserved | This read-only field is reserved and always has the value 0. |
| 13–8 ISO2SW | After asserting isolation, the PGC waits a number of clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). NOTE: ISO2SW must not be programmed to zero. |
| 7–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5–0 ISO | After a power-down request (pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO before asserting isolation. NOTE: ISO must not be programmed to zero. |

27.9.4 Power Gating Controller Status Register (PGC_GPU_SR)

The PDNSCR contains the power-down timing parameters.

Address: 20D_C000h base + 26Ch offset = 20D_C26Ch

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

PGC_GPU_SR field descriptions

| Field | Description |
|------------------|--|
| 31–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 PSR | Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down. 0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request. |

27.9.5 PGC Control Register (PGC_CPU_CTRL)

The PGCR enables the response to a power-down request.

Address: 20D_C000h base + 2A0h offset = 20D_C2A0h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |

PGC_CPU_CTRL field descriptions

| Field | Description |
|------------------|---|
| 31–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 PCR | <p>Power Control</p> <p>NOTE: PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up.</p> <p>0 Do not switch off power even if pdn_req is asserted.</p> <p>1 Switch off power when pdn_req is asserted.</p> |

27.9.6 Power Up Sequence Control Register (PGC_CPU_PUPSCR)

The PUPSCR contains the power-up timing parameters.

Address: 20D_C000h base + 2A4h offset = 20D_C2A4h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|

PGC_CPU_PUPSCR field descriptions

| Field | Description |
|-------------------|--|
| 31–14 Reserved | This read-only field is reserved and always has the value 0. |
| 13–8 SW2ISO | After asserting , the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation. NOTE: SW2ISO must not be programmed to zero. The SW2ISO value should be chosen such that the delay before negating isolation is greater than the LDO ramp-up time. |
| 7–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5–0 SW | After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting . NOTE: SW must not be programmed to zero. NOTE: The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See Clock Controller Module (CCM) . |

27.9.7 Pull Down Sequence Control Register (PGC_CPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D_C000h base + 2A8h offset = 20D_C2A8h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|-----|---|---|---|---|---|--|--|

DVFSC_DVFSSIG0 field descriptions

| Field | Description |
|---------------|--|
| 31–29 WSW5 | General purpose load tracking signal weight dvfs_w_sig[5] |
| 28–26 WSW4 | General purpose load tracking signal weight dvfs_w_sig[4] |
| 25–23 WSW3 | General purpose load tracking signal weight dvfs_w_sig[3] |
| 22–20 WSW2 | General purpose load tracking signal weight dvfs_w_sig[2] |
| 19–12 - | This field is reserved. Reserved |
| 11–6 WSW1 | General purpose load tracking signal weight dvfs_w_sig[1]. This value is relevant during GPC1 counting period or when GPB1 is set. |
| 5–0 WSW0 | General purpose load tracking signal weight dvfs_w_sig[0]. This value is relevant during GPC0 counting period or when GPB0 is set. |

27.10.5 DVFS general purpose bit 0 weight counter (DVFSC_DVFSGPC0)

DVFS general purpose bits weight counter.

Address: 20D_C180h base + 10h offset = 20D_C190h

DVFSC_DVFSGPC0 field descriptions

| Field | Description |
|--------------|---|
| 31 C0STRT | C0STRT - Counter 0 start Setting of this bit will initialize down counting of the GPC0 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC0 counter to the GPC0 value. GPB0 bit disables (overrides) GPC0 counter - WSW0 weight is applicable continuously |
| 30 C0ACT | C0ACT - Counter 0 active indicator |

Table continues on the next page...

DVFSC_DVFSGPC0 field descriptions (continued)

| Field | Description |
|---------------|--|
| | 1 General Purpose bit0 counter didn't reach value of "0" - the WSW0 is provided to DVFS calculation 0 General Purpose bit0 counter reached value of "0" - the instead of WSW0, "0" (zero) is provided to DVFS calculation |
| 29–17 - | This field is reserved. reserved |
| 16–0 GPBC0 | GPBC0 - General Purpose bits Counter 0 During period of this counter the GeP bit 0 will be set and WSW0 will be added to the calculations. |

27.10.6 DVFS general purpose bit 1 weight counter (DVFSC_DVFSGPC1)

DVFS general purpose bits weight counter1.

Address: 20D_C180h base + 14h offset = 20D_C194h

DVFSC_DVFSGPC1 field descriptions

| Field | Description |
|---------------|--|
| 31 C1STRT | C1STRT - Counter 1start Setting of this bit will initialize down counting of the GPC1 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC1 counter to the GPC1 value. GPB1 bit disables (overrides) GPC1 counter - WSW1 weight is applicable continuously |
| 30 C1ACT | C1ACT - Counter 1 active indicator 1 General Purpose bit1 counter didn't reach value of "0" - the WSW1 is provided to DVFS calculation 0 General Purpose bit1 counter reached value of "0" - the instead of WSW1, "0" (zero) is provided to DVFS calculation |
| 29–17 - | This field is reserved. reserved |
| 16–0 GPBC1 | GPBC1 - General Purpose bits Counter 1 During period of this counter the GeP bit 1 will be set and WSW1 will be added to the calculations. |

DVFSC_CNTR field descriptions

| Field | Description |
|-----------------|--|
| 31–29 DIV3CK | DIV3CK - div_3_clk division ratio inside the DVFS module. According to the Table 27-35 |
| 28 DVFEV | Always give a DVFS event. 0 Do not give an event always. 1 Always give event. |
| 27 LBMI | Load buffer full mask interrupt. This bit masks the generation of this interrupt. Load buffer full interrupt is masked (LBFL0 and LBFL1 bits still will be updated, but interrupt won't be generated) Load buffer full interrupt is enabled. |
| 26 LBFL1 | Load buffer 1 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer0 is full. 0 Load buffer0 is not full. |
| 25 LBFL0 | Load buffer 0 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) |

Table continues on the next page...

DVFS_CNTR field descriptions (continued)

| Field | Description |
|---------------------|---|
| | 1 Load buffer1 is full. 0 Load buffer1 is not full. |
| 24 DVFS | DVFS Interrupt select. These bits define destination of DVFS interrupts. 1 MCU interrupt will be generated for DVFS events. 0 SDMA interrupt will be generated for DVFS events. |
| 23 PIRQS | PIRQS - Pattern IRQ Source * write '1' to clear. Writing '1' will clear interrupt if interrupt was from pattern 1 DVFS IRQ source was from pattern 0 DVFS IRQ source was not from pattern |
| 22 FSVAIM | DVFS Frequency adjustment interrupt mask. This bit masks the DVFS frequency adjustment interrupt. FSVAI status bits will be still asserted in relevant cases. 1 interrupt is masked. 0 interrupt is enabled. |
| 21–20 FSVAI[1:0] | FSVAI DVFS Frequency adjustment interrupt. These status bits indicate that the system frequency should be changed. 00 no interrupt 01 frequency should be increased. Low priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). 10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency). 11 frequency should be increased immediately. High priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). |
| 19 Reserved | This read-only field is reserved and always has the value 0. |
| 18 MAXF | Maximum frequency reached. Interrupt will not be created in maximum frequency reached and frequency increase required. 1 max frequency reached 0 max frequency not reached |
| 17 MINF | Minimum frequency reached. Interrupt will not be created in minimum frequency reached and frequency decrease required. 1 min frequency reached 0 min frequency not reached |
| 16–11 DIV_RATIO | DIV_RATIO - Divider value. Divider divides the input ARM clock, following the table Table 27-36 |
| 10 Reserved | This read-only field is reserved and always has the value 0. |
| 9 PFUE | PFUE - Period Frequency Update Enable 1 enabled 0 disabled |
| 8–6 PFUS | PFUS - Periodic Frequency Update Status |

Table continues on the next page...

Chapter 28

General Purpose Input/Output (GPIO)

28.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

[Figure 28-1](#) shows the chip multiplexing scheme.

Figure 28-1. Chip IOMUX Scheme

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO_DR)
- GPIO direction register (GPIO_GDIR)
- Pad sample register (GPIO_PSR)
- Interrupt control registers (GPIO_ICR1, GPIO_ICR2)

- Edge select register (GPIO_EDGE_SEL)
- Interrupt mask register (GPIO_IMR)
- Interrupt status register (GPIO_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for $n = 0 - 7$). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

28.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 28-2](#).

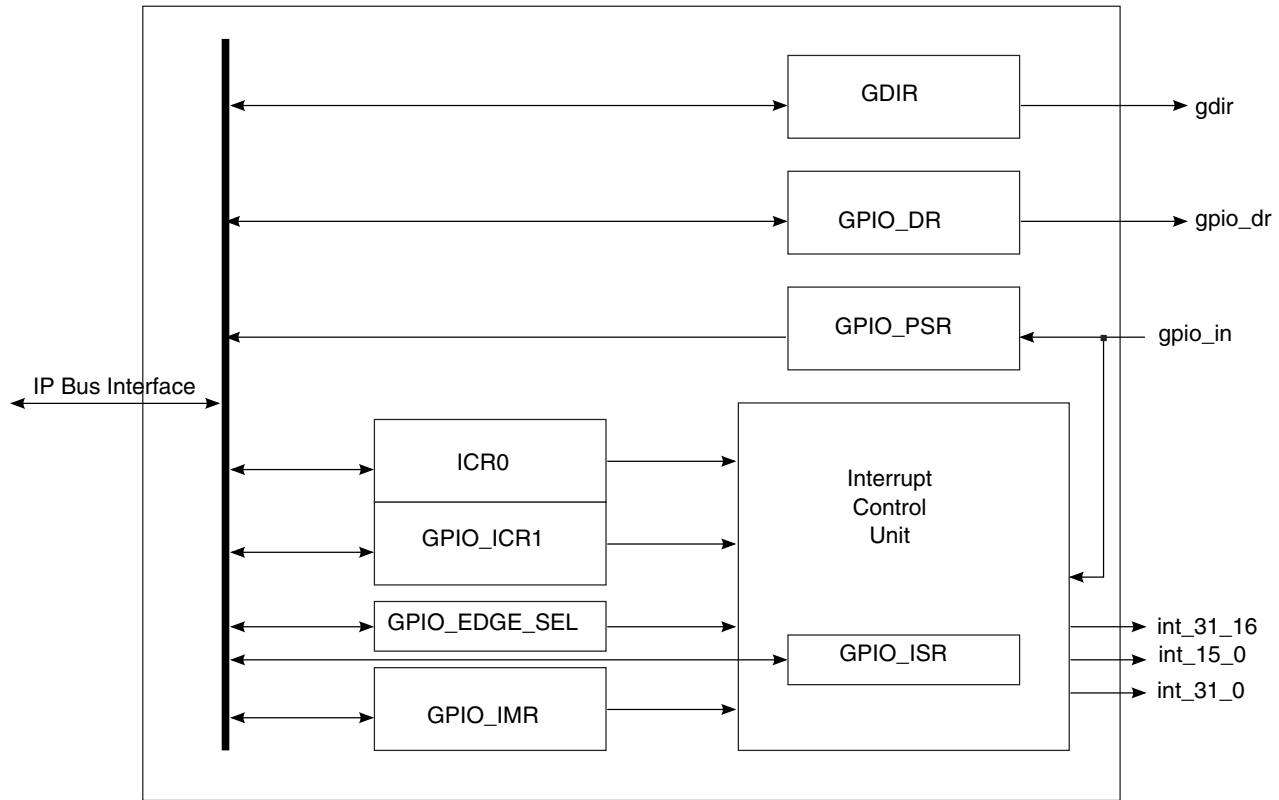

Figure 28-2. GPIO Block Diagram

28.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
 - Drives specific data to output using the data register (GPIO_DR)
 - Controls the direction of the signal using the GPIO direction register (GPIO_GDIR)
 - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO_PSR).
- GPIO interrupt capabilities:
 - Supports up to 32 interrupts

- Identifies interrupt edges
- Generates three active-high interrupts to the SoC interrupt controller

28.2 External Signals

The tables found here describe the external signals of GPIO.

Table 28-1. GPIO1 External Signals

| Signal | Description | Pad | Mode | Direction |
|------------|-------------|--------------|------|-----------|
| GPIO1_IO00 | - | GPIO_0 | ALT5 | IO |

28.3 Clocks

The table found here describes the clock sources for GPIO.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 28-8. GPIO Clocks

| Clock name | Clock Root | Description |
|------------|--------------|-------------------------|
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

28.4 GPIO Functional Description

This section provides a complete functional description of the block.

28.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO_GDIR).

When configured as an output (GPIO_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO_GDIR bit = 0), the state of the input can be read from the corresponding GPIO_PSR bit.

28.4.2 GPIO Programming

28.4.2.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
```

read PSR

NOTE

While the GPIO direction is set to input (GPIO_GDIR = 0), a read access to GPIO_DR does not return GPIO_DR data. Instead, it returns the GPIO_PSR data, which is the corresponding input signal value.

28.4.2.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

28.4.3 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO_ICR1 and GPIO_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO_ICR1 and GPIO_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

28.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

GPIO memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|---|-----------------|--------|-------------|-----------------------------|
| 209_C000 | GPIO data register (GPIO1_DR) | 32 | R/W | 0000_0000h | 28.5.1/1404 |

28.5.2 GPIO data register (GPIOx_DR)

The 32-bit GPIO_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

GPIOx_DR field descriptions

| Field | Description |
|------------|---|
| 31–0 DR | Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0). NOTE: The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value. |

28.5.3 GPIO direction register (GPIOx_GDIR)

GPIO_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

GPIOx_GDIR field descriptions

| Field | Description |
|--------------|---|
| 31–0 GDIR | GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal. NOTE: GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO. |

GPIOx_GDIR field descriptions (continued)

| Field | Description |
|-------|---|
| 0 | INPUT — GPIO is configured as input. |
| 1 | OUTPUT — GPIO is configured as output. |

28.5.4 GPIO pad status register (GPIOx_PSR)

GPIO_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the ipg_clk_s clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

28.5.8 GPIO interrupt status register (GPIOx_ISR)

The GPIO_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

GPIOx_ISR field descriptions

| Field | Description |
|-------------|--|
| 31–0 ISR | <p>Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.</p> |

GPIOx_ISR field descriptions (continued)

| Field | Description |
|-------|--|
| | When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position. |

28.5.9 GPIO edge select register (GPIOx_EDGE_SEL)

GPIO_EDGE_SEL may be used to override the ICR registers' configuration. If the GPIO_EDGE_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

Chapter 29

General Purpose Media Interface (GPMI)

29.1 Overview

The GPMI controller is a flexible interface to supporting up to four NAND flash chip selects.

- ONFI 2.2, DDR Mode, Samsung/Toshiba Toggle NAND protocol compatible
- Fully configurable address and command behavior, providing support for future devices not yet specified.

The GPMI resides on the APBH. The GPMI also provides an interface to the BCH module to allow direct parity processing.

Registers are clocked on the HCLK domain. The I/O and pin timing are clocked on a dedicated GPMICLK domain. GPMICLK can be set to maximize I/O performance.

The figure below shows a block diagram of the GPMI controller.

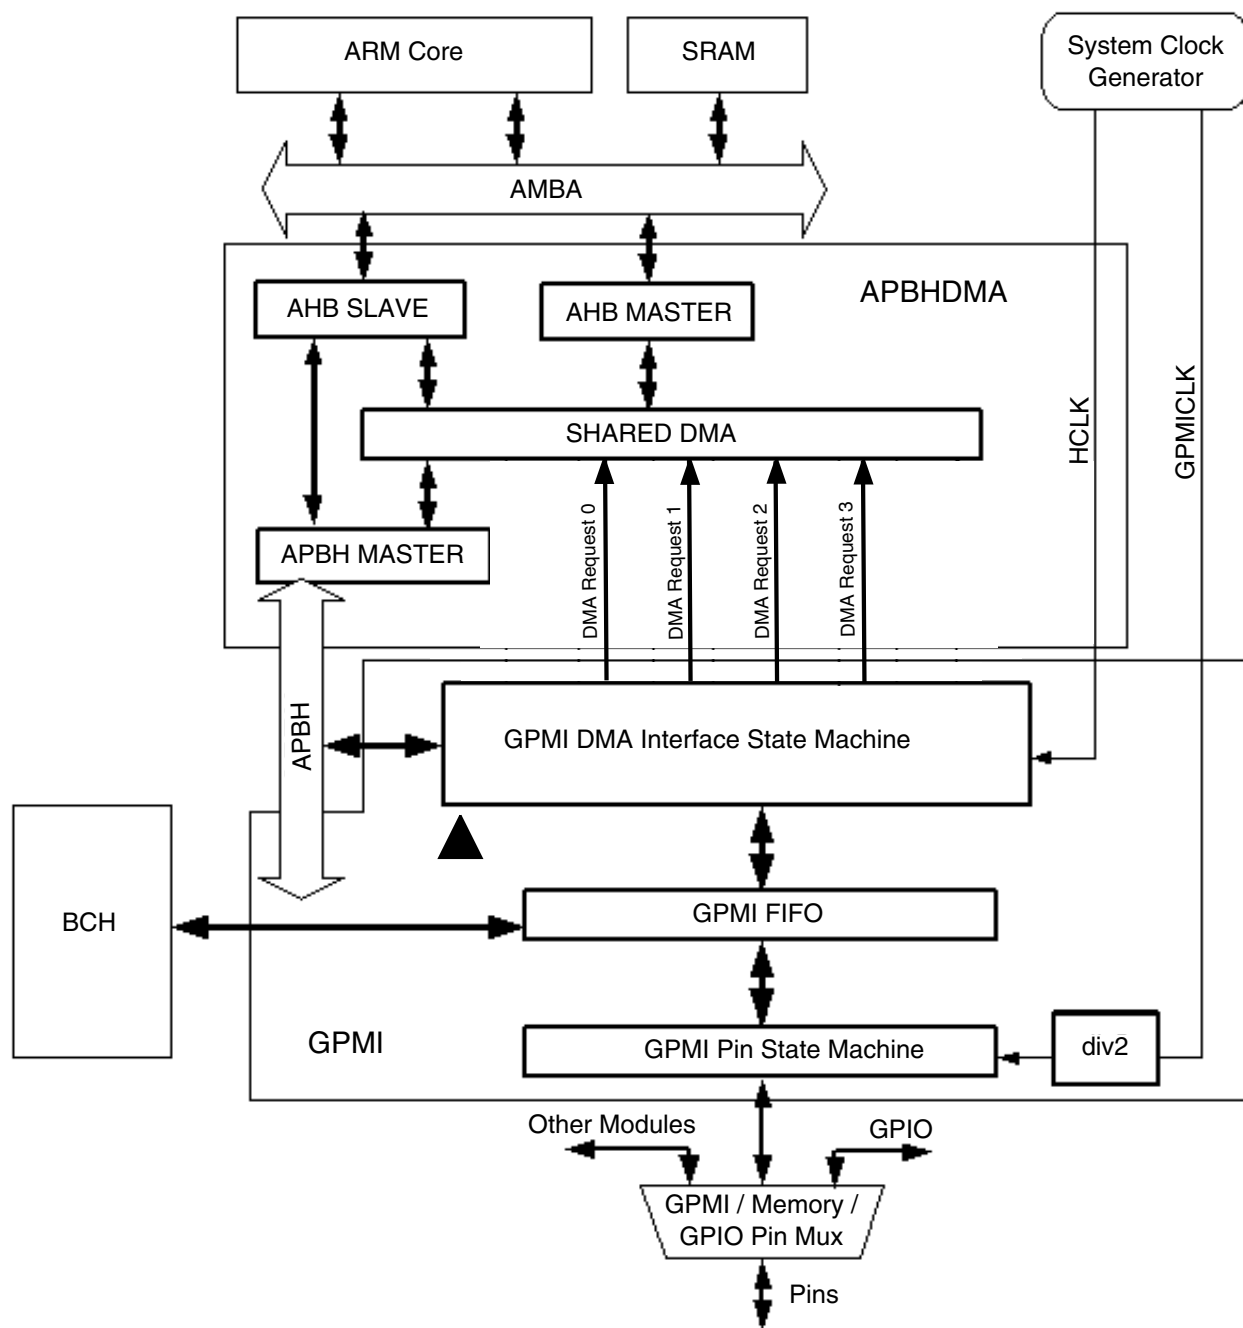

Figure 29-1. General-Purpose Media Interface Controller Block Diagram

29.2 External Signals

The table found here describes the external signals of GPMI.

Table 29-1. GPMI External Signals

| Signal | Description | Pad | Mode | Direction |
|-------------|-----------------------------|------------|------|-----------|
| NAND_ALE | Address latch enable signal | NANDF_ALE | ALT0 | O |
| NAND_CE0_B | Chip enable signal | NANDF_CS0 | ALT0 | O |
| NAND_CE1_B | Chip enable signal | NANDF_CS1 | ALT0 | O |
| NAND_CE2_B | Chip enable signal | NANDF_CS2 | ALT0 | O |
| NAND_CE3_B | Chip enable signal | NANDF_CS3 | ALT0 | O |
| NAND_CLE | Command latch enable signal | NANDF_CLE | ALT0 | O |
| NAND_DATA00 | Data signal | NANDF_D0 | ALT0 | I/O |
| NAND_DATA01 | Data signal | NANDF_D1 | ALT0 | I/O |
| NAND_DATA02 | Data signal | NANDF_D2 | ALT0 | I/O |
| NAND_DATA03 | Data signal | NANDF_D3 | ALT0 | I/O |
| NAND_DATA04 | Data signal | NANDF_D4 | ALT0 | I/O |
| NAND_DATA05 | Data signal | NANDF_D5 | ALT0 | I/O |
| NAND_DATA06 | Data signal | NANDF_D6 | ALT0 | I/O |
| NAND_DATA07 | Data signal | NANDF_D7 | ALT0 | I/O |
| NAND_DQS | DQS signal | SD4_DAT0 | ALT2 | I/O |
| NAND_READY | Ready signal | NANDF_RB0 | ALT0 | I/O |
| NAND_RE_B | Read enable signal | SD4_CMD | ALT1 | O |
| NAND_WE_B | Write enable signal | SD4_CLK | ALT1 | O |
| NAND_WP_B | Wait polarity signal | NANDF_WP_B | ALT0 | O |

29.3 Clocks

The table found here describes the clock sources for GPMI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 29-2. GPMI Clocks

| Clock name | Clock Root | Description |
|----------------------------|-----------------|-------------------------|
| bch_input_apb_clk | usdhc3_clk_root | BCH to APBH input clock |
| gpmi_bch_input_bch_clk | usdhc4_clk_root | BCH input clock |
| gpmi_bch_input_gpmi_io_clk | enfc_clk_root | GPMI IO input clock |
| gpmi_input_apb_clk | usdhc3_clk_root | GPMI to APBH clock |

29.4 GPMI NAND Mode

The general-purpose media interface has several features to efficiently support NAND:

- Individual chip select pins and ganged ready/busy pin for up to four NANDs.
- Individual state machine and DMA channel for each chip select.
- Special command modes work with DMA controller to perform all normal NAND functions without CPU intervention.
- Configurable timing based on a dedicated clock allows optimal balance of high NAND performance and low system power.

GPMI and DMA have been designed to handle complex multi-page operations without CPU intervention. The DMA uses a linked descriptor function with branching capability to automatically handle all of the operations needed to read/write multiple pages:

- **Data/Register Read/Write**-The GPMI can be programmed to read or write multiple cycles to the NAND address, command or data registers.
- **Wait for NAND Ready**-The GPMI's Wait-for-Ready mode can monitor the ready/busy signal of a single NAND flash and signal the DMA when the device has become ready. It also has a time-out counter and can indicate to the DMA that a time-out error has occurred. The DMAs can conditionally branch to a different descriptor in the case of an error.
- **Check Status**-The Read-and-Compare mode allows the GPMI to check NAND status against a reference. If an error is found, the GPMI can instruct the DMA to branch to an alternate descriptor, which attempts to fix the problem or asserts a CPU IRQ.

29.4.1 Multiple NAND Support

The GPMI supports up to four NAND chip selects, with ganged ready/busy pins.

Since they share a data bus and control lines, the GPMI can only actively communicate with a single NAND at a time. However, all NANDs can concurrently perform internal read, write, or erase operations. With fast NAND flash and software support for concurrent NAND operations, this architecture allows the total throughput to approach the data bus speed, which can be as high as 50 MB/s (8-bit bus running at 50 MHz single clock edge) in asynchronous mode and 200MB/s (8-bit bus running at 100MHz both clock edges) in Source Synchronous mode.

There are two options for controlling the four NAND chip selects via the DMA interface. The first option is the one to one mapping, where the each DMA channel is tied to its own NAND chip select. For example DMA channel 'n' accesses only NAND attached to chip select 'n'. The second option is the decoupled mode where a DMA channel can access any or all NAND chip selects connected to the GPMI. A DMA channel will signify the NAND chip select it wants to access by writing its chip select value in the GPMI_CTRL0[CS] field and setting the GPMI_CTRL1[DECOUPLE_CS] to 1. This option is useful if software chooses to use only one DMA channel to access all the attached NAND devices.

29.4.2 GPMI NAND Timing and Clocking

The dedicated clock, GPMICK, is used as a timing reference for NAND flash I/O. Since various NANDs have different timing requirements, GPMICK may need to be adjusted for each application.

While the actual pin timings are limited by the NAND chips used and the I/O pad configuration, the GPMI can support data bus speeds of up to 200 MHz x 8 bits. The actual read/write strobe timing parameters are adjusted as indicated in the register descriptions in Memory Map.

29.4.3 Basic NAND Timing

29.4.3.1 NAND Asynchronous Timing

[Figure 29-3](#) and illustrates the operation of the output (from host to device) timing parameters in NAND ONFI asynchronous mode.

- t_{AS} is configurable by programming HW_GPMI_TIMING0 Address_Setup: in this example, Address_Setup = 4, t_{AS} is equal to 4 dev_clk cycles.
- t_{DS} is configurable by programming HW_GPMI_TIMING0 Data_Setup: in this example, Data_Setup = 3, t_{DS} is equal to 3 dev_clk cycles
- t_{DH} is configurable by programming HW_GPMI_TIMING0 Data_Hold: in this example, Data_Hold = 2, t_{DH} is equal to 2 dev_clk cycles
- $t_{AS}/t_{DS}/t_{DH}$ will extend, if the output data is not ready in device fifo.

Figure 29-2. Asynchronous Mode Basic Write Timing Diagram (command write, address write, or data write)

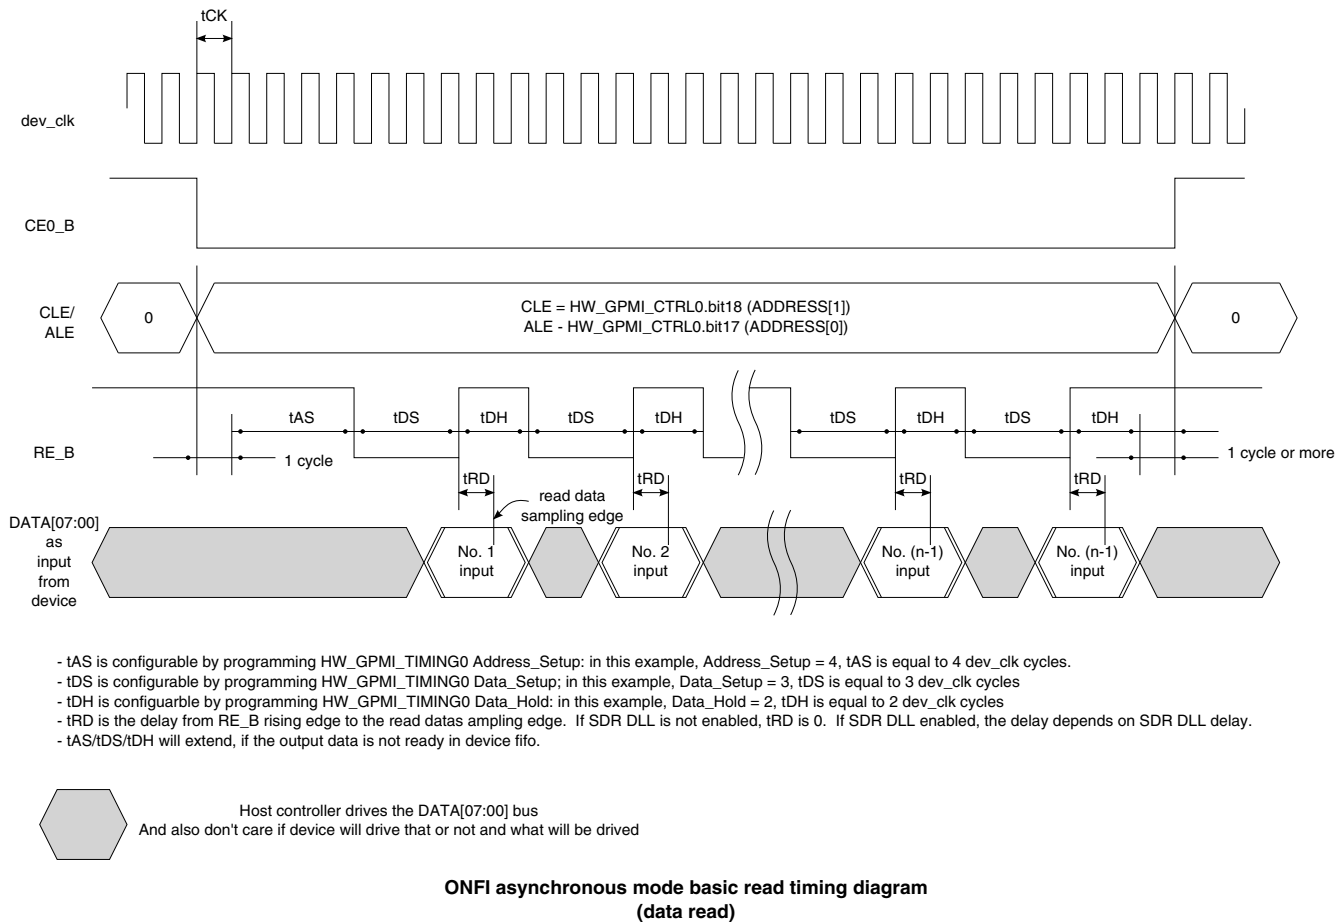

Figure 29-3. ONFI Asynchronous Mode Basic Read Timing Diagram (data read)

29.4.3.2 NAND Asynchronous EDO Mode Timing

In high-speed NANDS, the read data may not be valid until after the read strobe (NAND_RE_B) deasserts. This is the case when the minimum tDS is programmed to achieve higher bandwidth.

The GPMI implements a feedback read strobe to sample the read data. The feedback read strobe can be delayed to support fast nand EDO (Extended Data Out) timing where the read strobe may deassert before the read data is valid, and read data is valid for some time after read strobe.

Nand EDO timings is applied typically for read cycle frequency above 33 MHz. See [Figure 29-4](#).

The GPMI provides control over the amount of delay applied to the feedback read strobe. This delay depends on the maximum read access time (tREA) of the nand and the read pulse width (tRP) used to access the nand. tRP is specified by

GPMI_TIMING0[DATA_SETUP] register. When $(t_{REA} + 4ns)$ is less than t_{RP} , no delay is required to sample to nand read data. (The 4ns provides adequate data setup time for the GPMI.) In this case set $GPMI_CTRL1[HALF_PERIOD] = 0$;
 $GPMI_CTRL1[RDN_DELAY] = 0$; $GPMI_CTRL1[DLL_ENABLE] = 0$.

When $(t_{REA} + 4ns)$ is greater than or equal to t_{RP} , a delay of the feedback read strobe is required to sample to nand read data. This delay is equal to the difference between these two timings:

$$DELAY = t_{REA} + 4ns - t_{RP}.$$

Since the GPMI delay chain is limited to 12ns maximum, if $DELAY > 12ns$ then increase t_{RP} by increasing the value of $GPMI_TIMING0[DATA_SETUP]$ until $DELAY$ is less than or equal to 12ns.

The GPMI programming for this $DELAY$ depends on the GPMICLK period. The GPMI DLL will not function properly if the GPMICLK period is greater than 24ns: disable the DLL if this is the case. If the GPMICLK period is greater than 12ns (and not greater than 24ns), set the $GPMI_CTRL1[HALF_PERIOD]=1$; This will cause the DLL reference period (RP) to be one-half of the GPMICLK period. If the GPMICLK period is 12ns or less then set the $GPMI_CTRL1[HALF_PERIOD]=0$; This will cause the DLL reference period (RP) to be equal to the GPMICLK period. $DELAY$ is a multiple (0 to 1.875) of RP.

The $GPMI_CTRL1[RDN_DELAY]$ is encoded as a 1-bit integer and 3-bit fraction delay factor. $DELAY$ is a multiple of the delay factor and the reference period. See table below for details.

Table 29-3. RDN DELAY

| HW_GPMI_CTRL1[RDN_DELAY] | Delay Factor |
|--------------------------|--------------|
| 0 | 0.000 |
| 1 | 0.125 |
| 2 | 0.250 |
| 3 | 0.375 |
| 4 | 0.500 |
| 5 | 0.625 |
| 6 | 0.750 |
| 7 | 0.875 |
| 8 | 1.000 |
| 9 | 1.125 |
| 10 | 1.250 |
| 11 | 1.375 |
| 12 | 1.500 |

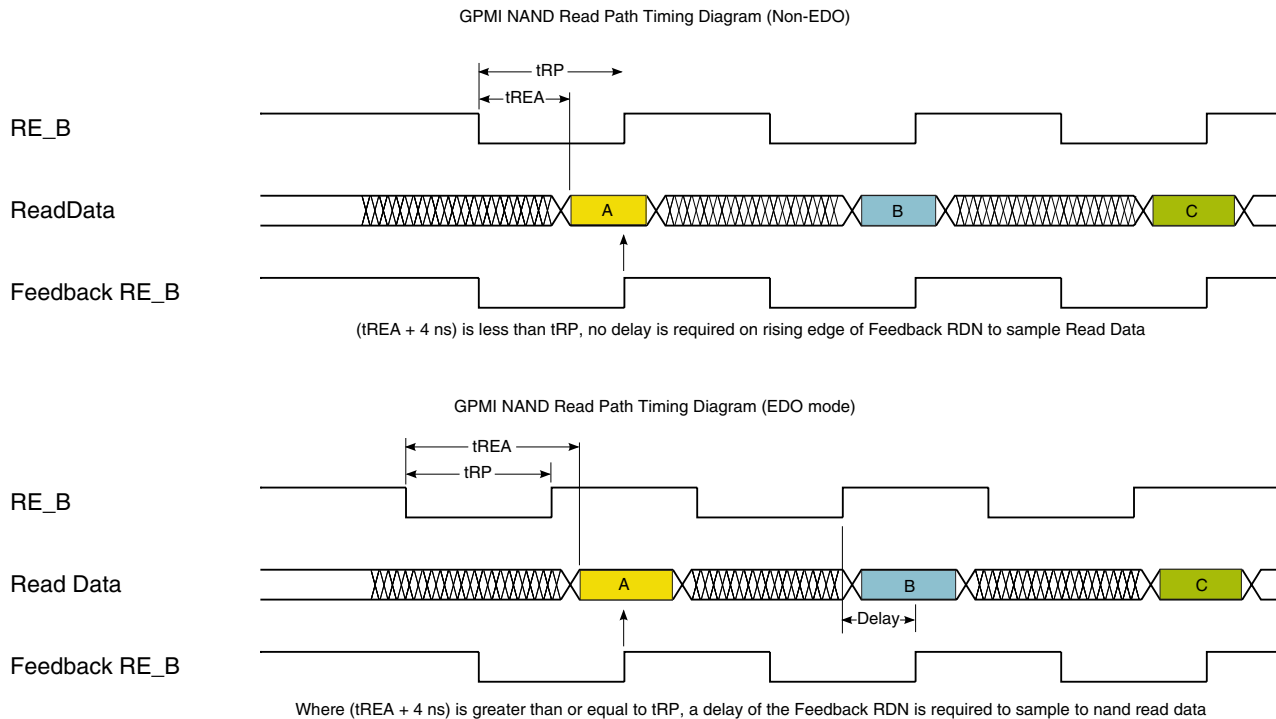

Table continues on the next page...

Table 29-3. RDN DELAY (continued)

| HW_GPMI_CTRL1[RDN_DELAY] | Delay Factor |
|--------------------------|--------------|
| 13 | 1.625 |
| 14 | 1.750 |
| 15 | 1.875 |

$DELAY = DelayFactor \times RP$ or $DELAY = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times RP$.

Use this equation to calculate the value for GPMI_CTRL1[RDN_DELAY]. Then set GPMI_CTRL1[DLL_ENABLE]=1.

**Figure 29-4. NAND Read Path Timing**

For example, a NAND with $tRE_{Amax} = 20 \text{ ns}$, $tRP_{min} = 12 \text{ ns}$, and $tRC_{min} = 25 \text{ ns}$ (read cycle time) may be programmed as follows:

- GPMICLK clock frequency: Consider $480/6 = 80 \text{ MHz}$ which is 12.5 ns clock period. This is too close to the minimum NAND spec if we program the data setup and hold to 1 GPMICLK cycle. Consider $480/7 = 68.57 \text{ MHz}$ which is 14.58 ns clock period. With data setup and hold set to 1, we have a tRP of 14.58 ns and a tRC of 29.16 ns (good margins).

- Since $(t_{REA} + 4ns)$ is greater than t_{RP} , required $DELAY = t_{REA} + 4ns - t_{RP} = 20 + 4 - 14.58ns = 9.42 ns$.
- $GPMI_CTRL1[HALF_PERIOD] = 1$, since $GPMICLK$ period is large than 12ns. So $RP = GPMICLK \text{ period} = 7.29ns$.
- $DELAY = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times RP$. $9.42 ns = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times 7.29ns$. $GPMI_CTRL1[RDN_DELAY] = 10$ (round of 10.33)

For ONFI spec EDO timing mode 4/5, It's recommended to have below settings.

EDO timing mode 5 :

$GPMICLK = 100MHz$; $GPMI_CTRL1[RDN_DELAY] = 8$; $GPMI_CTRL1[HALF_PERIOD] = 0$;

EDO timing mode 4 :

$GPMICLK = 80MHz$; $GPMI_CTRL1[RDN_DELAY] = 15$; $GPMI_CTRL1[HALF_PERIOD] = 1$;

NOTE

It is recommended that the drive strength of $NAND_RE_B$ and $NAND_WE_B$ output pins be set to 8 mA. This will reduce the transition time under heavy loads. Low transition times will be important when NAND interface read and write cycle times are below 30 ns. The other GPMI pins may remain at 4 mA, since their frequency is only up to half that of $NAND_RE_B$ and $NAND_WE_B$.

29.4.3.3 NAND ONFI Source Synchronous Mode Timing

NOTE

In the following figures, CLK shares the same pin as WE_B in Async Mode. And $W/R\#$ shares the same pin as RE_B in Async Mode.

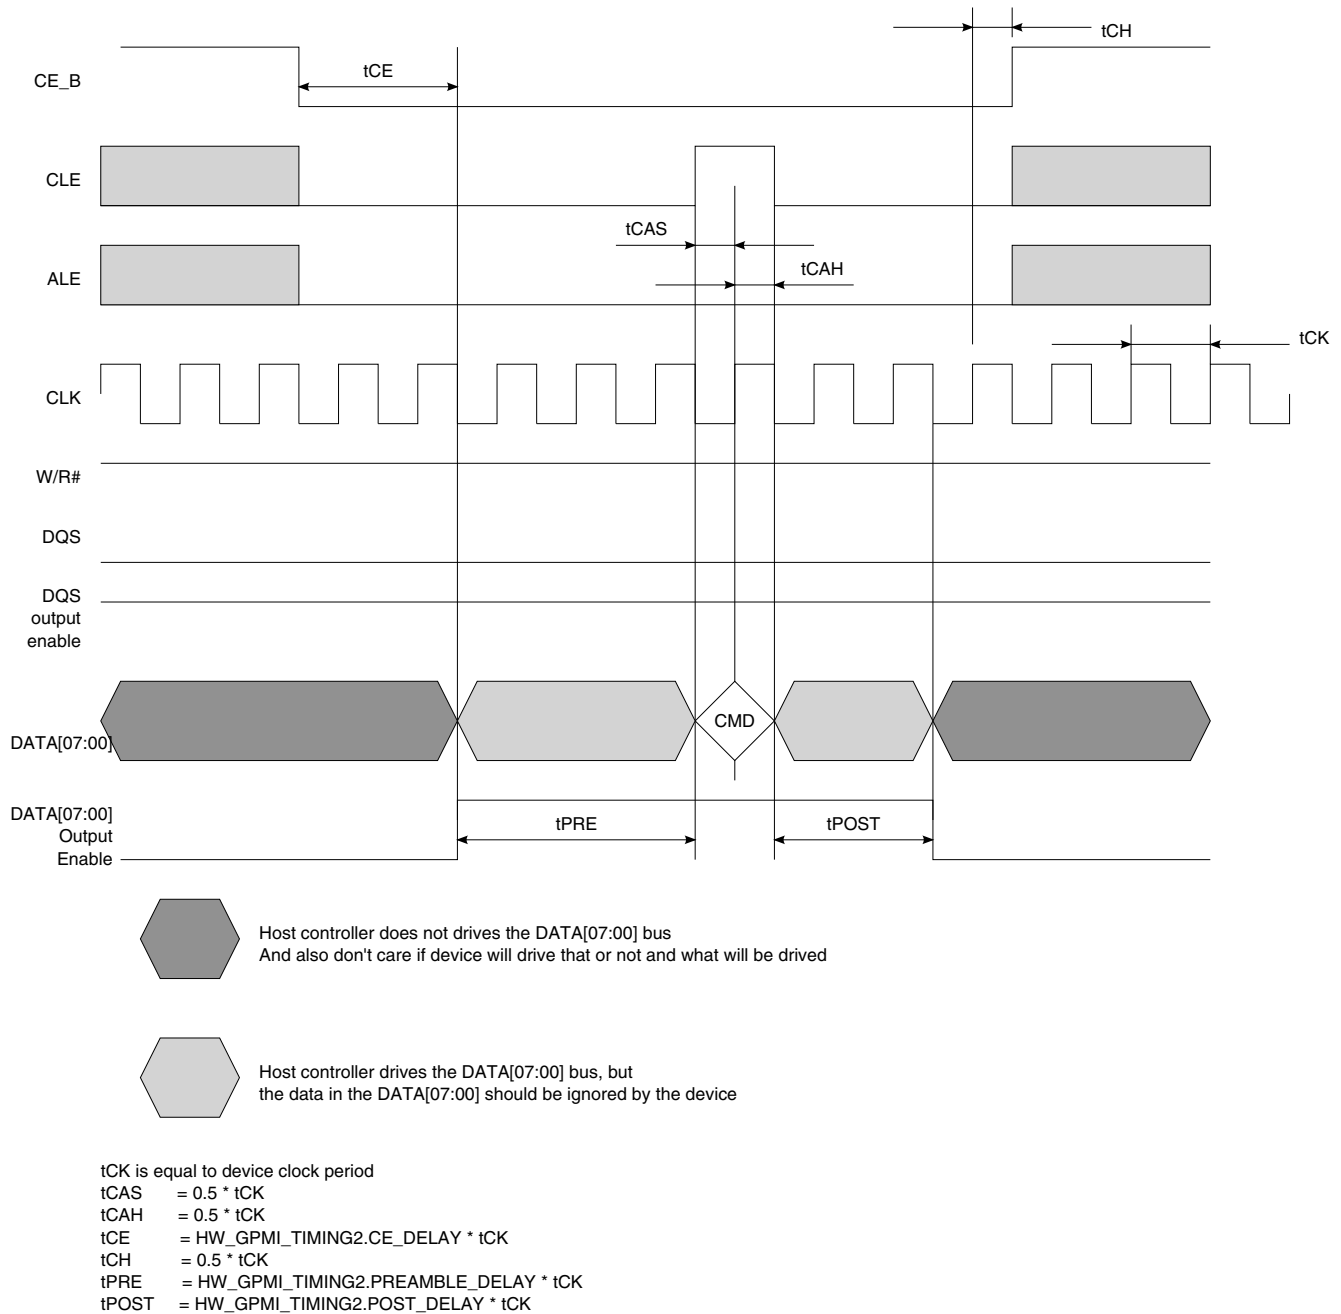

Figure 29-5. ONFI Source Synchronous Mode Basic Command Write Timing Diagram

Host controller does not drive the DATA[07:00] bus
And also don't care if device will drive that or not and what will be driven.

Host controller drives the DATA[07:00] bus, but
the data in the DATA[07:00] should be ignored by the device

t_{CK} is equal to device clock period

$t_{CAS} = 0.5 * t_{CK}$

$t_{CAH} = 0.5 * t_{CK}$

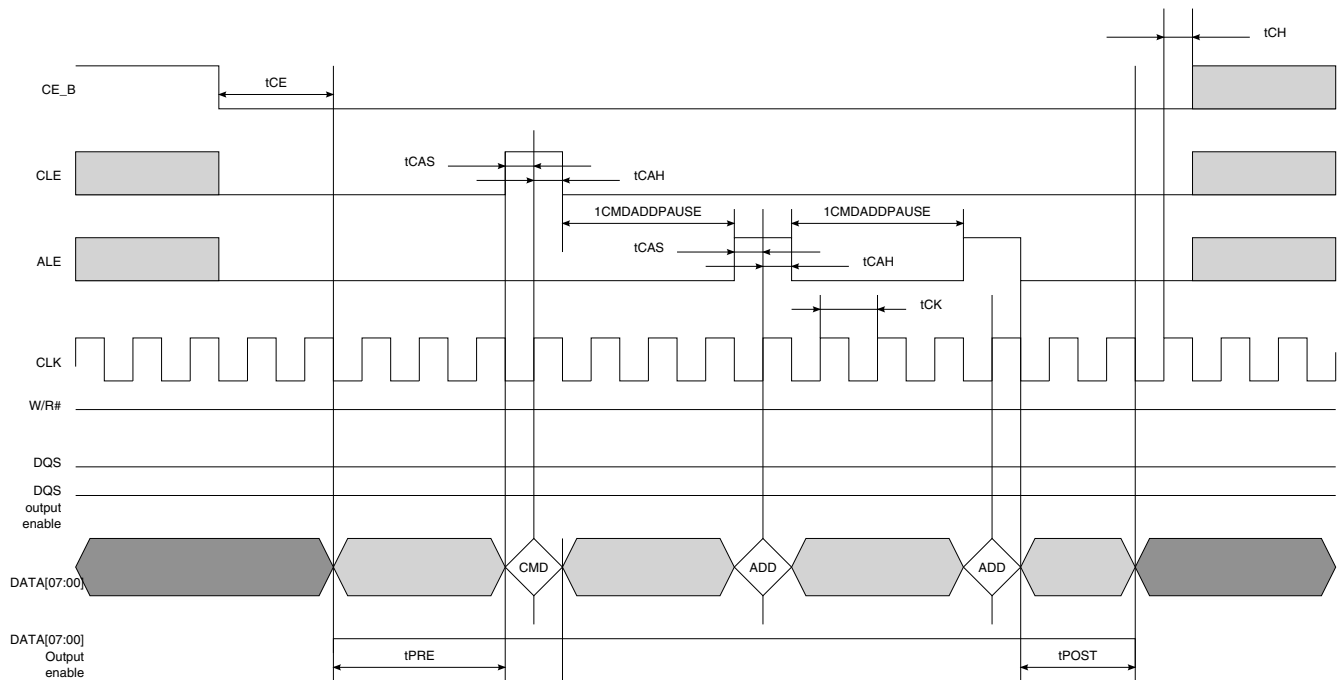

$t_{CE} = HW_GPMI_TIMING2.CE_DELAY * t_{CK}$

$t_{CH} = 0.5 * t_{CK}$

$t_{PRE} = HW_GPMI_TIMING2.PREAMBLE_DELAY * t_{CK}$

$t_{POST} = HW_GPMI_TIMING2.POST_DELAY * t_{CK}$

Figure 29-6. ONFI Source Synchronous Mode Basic Address Write Timing Diagram

 Host controller does not drive the DATA[07:00] bus
And also do not care if device will drive that or not and what will be driven.

 Host controller drives the DATA[07:00] bus, but
the data in the DATA[07:00] should be ignored by the device

t_{CK} is equal to device clock period

$t_{CAS} = 0.5 * t_{CK}$

$t_{CAH} = 0.5 * t_{CK}$

$t_{CE} = HW_GPMI_TIMING2.CE_DELAY * t_{CK}$

$t_{CH} = 0.5 * t_{CK}$

$t_{PRE} = HW_GPMI_TIMING2.PREAMBLE_DELAY * t_{CK}$

$t_{POST} = HW_GPMI_TIMING2.POST_DELAY * t_{CK}$

$t_{CMDADDPAUSE} = HW_GPMI_TIMING2.CMDADD_PAUSE * t_{CK}$

Figure 29-7. ONFI Source Synchronous Mode Command + Address Write Timing Diagram

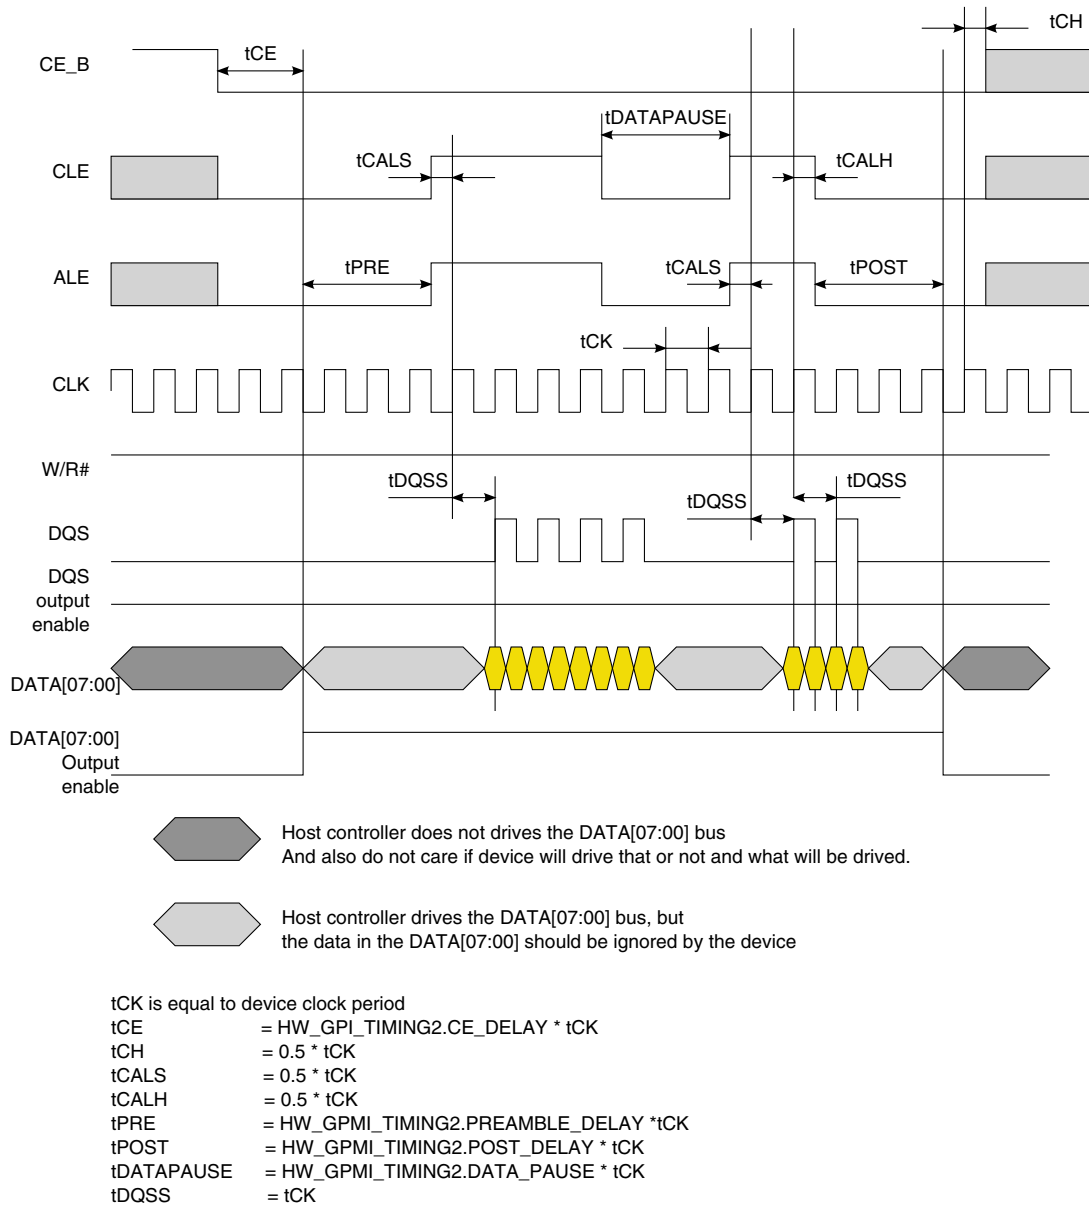

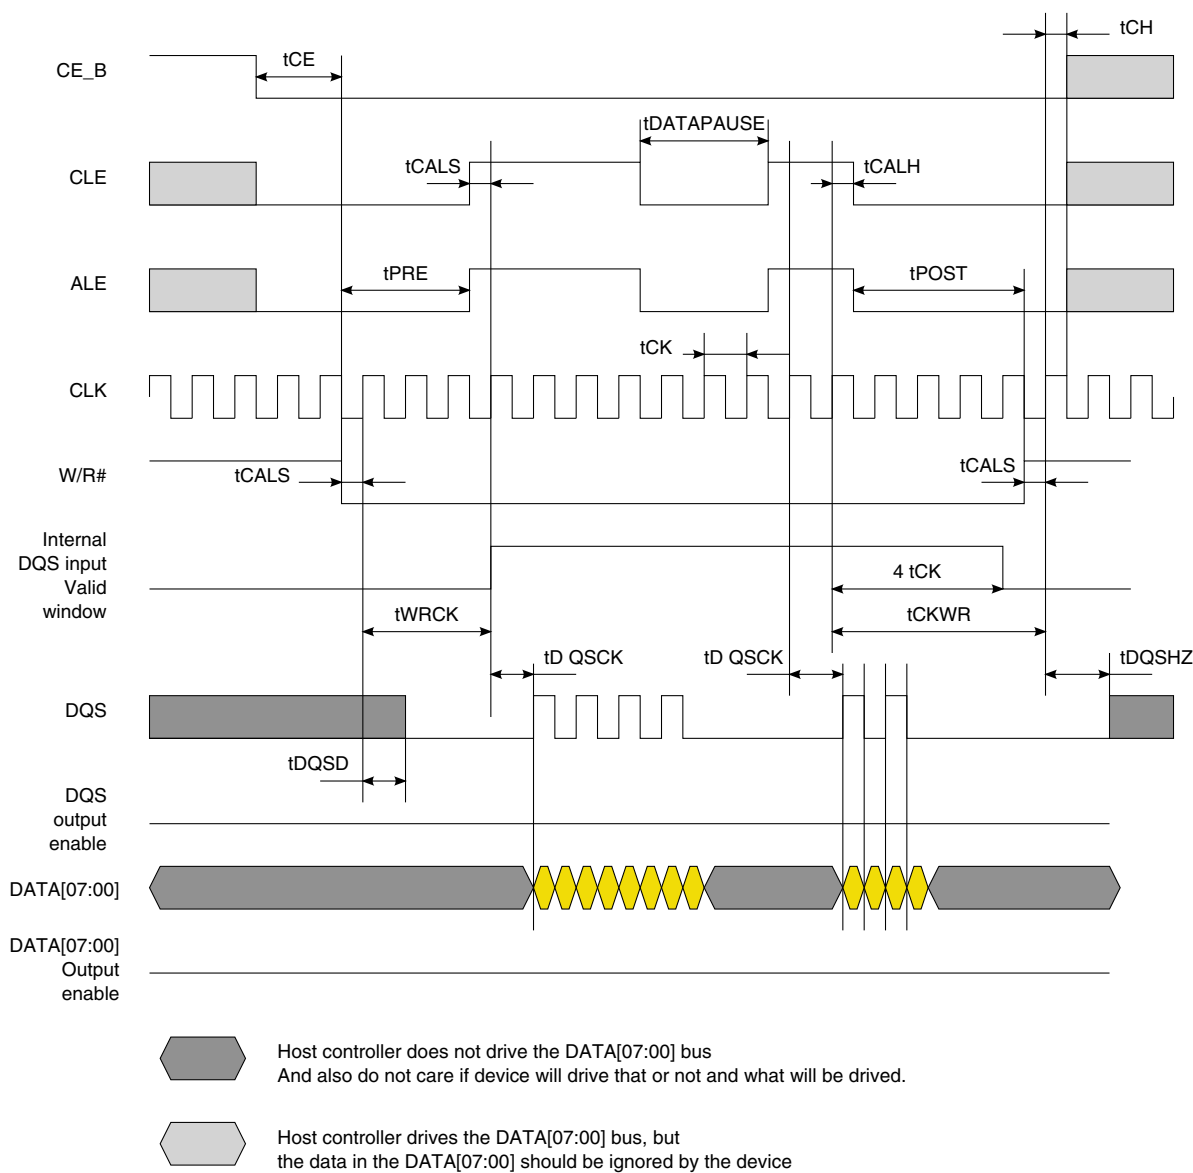

Figure 29-8. ONFI Source Synchronous Mode Data Write Timing Diagram

tCK is equal to device clock period

tCE = HW_GPI_TIMING2.CE_DELAY * tCK

tCH = 0.5 * tCK

tCALS = 0.5 * tCK

tCALH = 0.5 * tCK

tPRE = HW_GPMI_TIMING2.PREAMBLE_DELAY * tCK

tPOST = HW_GPMI_TIMING2.POST_DELAY * tCK

tDATA PAUSE = HW_GPMI_TIMING2.DATA_PAUSE * tCK

tWRCK/tCKWR/tDQSD/tDQSK/tDQSHZ are device parameters

29.4.4 Hardware BCH Interface

The GPMI provides an interface to the BCH module. This reduces the SOC bus traffic and the software involvement.

When BCH ECC is enable, parity information is inserted on-the-fly during writes to 8-bit NAND devices. The BCH will supply payload and parity to the GPMI to write to the NAND. During NAND reads, parity is checked and ECC processing is performed after each read block. In this case the GPMI reads the NAND device and redirects the data and parity to the BCH module for ECC processing.

To program the BCH for NAND writes, remove the soft reset and clock gates from BCH_CTRL[SFTRST] and BCH_CTRL[CLKGATE]. The bulk of BCH programming is actually applied to the GPMI via PIO operations embedded in its DMA command structures. This has a subtle implication when writing to the GPMI ECC registers: access to these registers must be written in progressive register order. Thus, to write to the GPMI_ECCCOUNT register, write first (in order) to registers GPMI_CTRL0, GPMI_COMPARE, and GPMI_ECCCTRL before writing to GPMI_ECCCOUNT. These additional register writes need to be accounted for in the CMDWORDS field of the respective DMA channel command register.

Note that the GPMI_PAYLOAD and GPMI_AUXILIARY pointers need to be word-aligned for proper ECC operation. If those pointers are non-word-aligned, then the BCH engine will not operate properly and could possibly corrupt system memory in the adjoining memory regions.

29.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST. The reset process gates the clocks automatically.

29.6 GPMI Memory Map/Register Definition

The following registers provide control for programmable elements of the GPMI module.

NOTE

All ATA or UDMA features are not supported for the chip.

GPMI memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |
|------------------------|---|-----------------|--------|-------------|-----------------------------|
| 11_2000 | GPMI Control Register 0 Description (GPMI_CTRL0) | 32 | R/W | C000_0000h | 29.6.1/1442 |

29.6.1 GPMI Control Register 0 Description (GPMI_CTRL0n)

The GPMI control register 0 specifies the GPMI transaction to perform for the current command chain item.

Address: 11_2000h base + 0h offset + (4d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |
|-------|------------|---------|-----|------------|---------|------|--------------|-------------|----|---------|-------------------|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | SFTRST | CLKGATE | RUN | DEV_IRQ_EN | LOCK_CS | UDMA | COMMAND_MODE | WORD_LENGTH | CS | ADDRESS | ADDRESS_INCREMENT | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | XFER_COUNT | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

GPMI_CTRL0n field descriptions

| Field | Description |
|---------------|--|
| 31 SFTRST | Set to zero for normal operation. When this bit is set to one (default), then the entire block is held in its reset state. This will not work if the CLKGATE bit is already set to '1'. CLKGATE must be cleared to '0' before issuing a soft reset. Also the GPMICK must be running for this to work properly. RUN = 0x0 Allow GPMI to operate normally. RESET = 0x1 Hold GPMI in reset. |
| 30 CLKGATE | Set this bit zero for normal operation. Setting this bit to one (default), gates all of the block level clocks off for minimizing AC energy consumption. RUN = 0x0 Allow GPMI to operate normally. NO_CLKS = 0x1 Do not clock GPMI gates in order to minimize power consumption. |
| 29 RUN | The GPMI is busy running a command whenever this bit is set to '1'. The GPMI is idle whenever this bit set to zero. This can be set to one by a CPU write. In addition, the DMA sets this bit each time a DMA command has finished its PIO transfer phase. IDLE = 0x0 The GPMI is idle. BUSY = 0x1 The GPMI is busy running a command. |

Table continues on the next page...

GPMI_CTRL0n field descriptions (continued)

| Field | Description |
|--------------------------|---|
| 28 DEV_IRQ_EN | When set to '1' and ATA_IRQ pin is asserted, the GPMI_IRQ output will assert. |
| 27 LOCK_CS | For ATA/NAND mode: 0= Deassert chip select (CS) after RUN is complete. 1= Continue to assert chip select (CS) after RUN is complete. For Camera Mode: 0= Dont wait for VSYNC rising edge before capturing data. 1= Wait for VSYNC rising edge before capturing data (Camera mode only). DISABLED = 0x0 Deassert chip select (CS) after RUN is complete. ENABLED = 0x1 Continue to assert chip select (CS) after RUN is complete. |
| 26 UDMA | DISABLED = 0x0 Use ATA-PIO mode on the external bus. ENABLED = 0x1 Use ATA-Ultra DMA mode on the external bus. 0 Use ATA-PIO mode on the external bus. 1 Use ATA-Ultra DMA mode on the external bus. |
| 25–24 COMMAND_ MODE | WRITE = 0x0 Write mode. READ = 0x1 Read mode. READ_AND_COMPARE = 0x2 Read and Compare mode (setting sense flop). WAIT_FOR_READY = 0x3 Wait for Ready mode. For ATA WAIT_FOR_READY command set CS=01. 00 Write mode. 01 Read Mode. 10 Read and Compare Mode (setting sense flop). 11 Wait for Ready. |
| 23 WORD_LENGTH | This bit should only be changed when RUN==0. Reserve = 0x0 Reserved. 8_BIT = 0x1 8-bit Data Bus mode. 0 Reserved. 1 8-bit Data Bus mode. |
| 22–20 CS | Selects which chip select is active for this command. For ATA WAIT_FOR_READY command, this must be set to b01. |
| 19–17 ADDRESS | Specifies the three address lines for ATA mode. In NAND mode, use A0 for CLE and A1 for ALE. NAND_DATA = 0x0 In NAND mode, this address is used to read and write data bytes. NAND_CLE = 0x1 In NAND mode, this address is used to write command bytes. NAND_ALE = 0x2 In NAND mode, this address is used to write address bytes. |
| 16 ADDRESS_ INCREMENT | In ATA mode, the address will increment with each cycle. In NAND mode, the address will increment once, after the first cycle (going from CLE to ALE). DISABLED = 0x0 Address does not increment. ENABLED = 0x1 Increment address. 0 Address does not increment. 1 Increment address. |
| 15–0 XFER_COUNT | Number of bytes to transfer for this command. A value of zero will transfer 64K bytes. |

29.6.2 GPMI Compare Register Description (GPMI_COMPARE)

The GPMI compare register specifies the expect data and the xor mask for comparing to the status values read from the device. This register is used by the Read and Compare command.

GPMI_COMPARE 0x010

Address: 11_2000h base + 10h offset = 11_2010h

GPMI_COMPARE field descriptions

| Field | Description |
|-------------------|---|
| 31–16 MASK | 16-bit mask which is applied after the read data is XORed with the REFERENCE bit field. |
| 15–0 REFERENCE | 16-bit value which is XORed with data read from the NAND device. |

29.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn)

The GPMI ECC control register handles configuration of the integrated ECC accelerator.

Address: 11_2000h base + 20h offset + (4d × i), where i=0d to 3d

GPMI_ECCCTRLn field descriptions

| Field | Description |
|------------------|--|
| 31–16 HANDLE | This is a register available to software to attach an identifier to a transaction in progress. This handle will be available from the ECC register space when the completion interrupt occurs. |
| 15 RSVD2 | Always write zeroes to this bit field. |
| 14–13 ECC_CMD | ECC Command information. DECODE = 0x0 Decode. ENCODE = 0x1 Encode. RESERVE2 = 0x2 Reserved. RESERVE3 = 0x3 Reserved. |

Table continues on the next page...

GPMI_ECCCTRLn field descriptions (continued)

| Field | Description |
|--------------------|--|
| 12 ENABLE_ECC | Enable ECC processing of GPMI transfers. ENABLE = 0x1 Use integrated ECC for read and write transfers. DISABLE = 0x0 Integrated ECC remains in idle. |
| 11–9 RSVD1 | Always write zeroes to this bit field. |
| 8–0 BUFFER_MASK | ECC buffer information. The BCH error correction only allows two configurations of the buffer mask - software may either read just the first block on the flash page or the entire flash page. Write operations must be for the entire flash page. Invalid buffer mask values will cause the DMA descriptor command to be terminated. BCH_AUXONLY = 0x100 Set to request transfer from only the auxiliary buffer (block 0 on flash). BCH_PAGE = 0x1FF Set to request transfer to/from the entire page. |

29.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT)

The GPMI ECC Transfer Count Register contains the count of bytes that flow through the ECC subsystem.

GPMI_ECCCOUNT 0x030

Address: 11_2000h base + 30h offset = 11_2030h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | <div>RSVD2</div> | | | | | | | | | | | | | | | | <div>COUNT</div> | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

GPMI_ECCCOUNT field descriptions

| Field | Description |
|----------------|--|
| 31–16 RSVD2 | Always write zeroes to this bit field. |
| 15–0 COUNT | Number of bytes to pass through ECC. This is the GPMI transfer count plus the syndrome count that will be inserted into the stream by the ECC. In DMA2ECC_MODE this count must match the GPMI_CTRL0_XFER_COUNT. A value of zero will transfer 64K words. |

29.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD)

The GPMI payload address register specifies the location of the data buffers in system memory. This value must be word aligned.

GPMI_PAYLOAD 0x040

Address: 11_2000h base + 40h offset = 11_2040h

| | | | | | | | | | | | | | | | | |
|-------|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | ADDRESS | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | ADDRESS | | | | | | | | | | | | | | RSVD0 | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

GPMI_PAYLOAD field descriptions

| Field | Description |
|-----------------|--|
| 31–2 ADDRESS | Pointer to an array of one or more 512 byte payload buffers. |
| 1–0 RSVD0 | Always write zeroes to this bit field. |

29.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)

The GPMI auxiliary address register specifies the location of the auxiliary buffers in system memory. This value must be word aligned.

GPMI_AUXILIARY 0x050

Address: 11_2000h base + 50h offset = 11_2050h

| | | | | | | | | | | | | | | | | |
|-------|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | ADDRESS | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | ADDRESS | | | | | | | | | | | | | | RSVD0 | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

GPMI_AUXILIARY field descriptions

| Field | Description |
|-----------------|---|
| 31–2 ADDRESS | Pointer to ECC control structure and meta-data storage. |
| 1–0 RSVD0 | Always write zeroes to this bit field. |

29.6.7 GPMI Control Register 1 Description (GPMI_CTRL1n)

The GPMI control register 1 specifies additional control fields that are not used on a per-transaction basis.

Address: 11_2000h base + 60h offset + (4d × i), where i=0d to 3d

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------|--------------|----------------|----------------|-------------|------------------|-----------|-------------|-------------|--------------------|------------------------------|-------|----------------|----------------|---------------------|-------------|-------------|
| R | DEV_CLK_STOP | SSYNC_CLK_STOP | WRITE_CLK_STOP | TOGGLE_MODE | GPMI_CLK_DIV2_EN | UPDATE_CS | SSYNCMODE | DECOUPLE_CS | WRN_DLY_SEL | | RSVD1 | TIMEOUT_IRQ_EN | GANGED_RDYBUSY | BCH_MODE | DLL_ENABLE | HALF_PERIOD |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | RDN_DELAY | | | | DMA2ECC_MODE | DEV_IRQ | TIMEOUT_IRQ | BURST_EN | ABORT_WAIT_REQUEST | ABORT_WAIT_FOR_READY_CHANNEL | | | DEV_RESET | ATA_IRQRDY_POLARITY | CAMERA_MODE | GPMI_MODE |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

GPMI_CTRL1n field descriptions

| Field | Description |
|------------------------|--|
| 31 DEV_CLK_STOP | set this bit to 1 will stop gpmi io working clk. |
| 30 SSYNC_CLK_STOP | set this bit to 1 will stop the source synchronous mode clk. |
| 29 WRITE_CLK_STOP | In onfi source synchronous mode, host may save power during the data write cycles by holding the CLK signal high (i.e. stopping the CLK). The host may only stop the CLK during data write, by setting this bit to 1, if the device supports this feature as indicated in the parameter page. |
| 28 TOGGLE_MODE | enable samsung toggle mode. |
| 27 GPMI_CLK_DIV2_EN | <p>This bit should be reset to 0 in asynchronous mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 1).</p> <p>This bit should be set to 1, in source synchronous mode or toggle mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 2).</p> <p>enable the gpmi clk divider.</p> <p>0x0 internal factor-2 clock divider is disabled 0x1 internal factor-2 clock divider is enabled.</p> |
| 26 UPDATE_CS | force the CS value is be updated to external chip select pin, even GPMI is idle. |
| 25 SSYNCMODE | <p>source synchronouse mode 1 or asynchronous mode 0.</p> <p>ASYNC = 0x0 Asynchronous mode.</p> <p>SSYNC = 0x1 Source Synchronous mode.</p> |
| 24 DECOUPLE_CS | Decouple Chip Select from DMA Channel. Setting this bit to 1 will allow a DMA channel to specify any value in the CTRL0_CS register field. Software can use one DMA channel to access all 8 Nand devices. |
| 23–22 WRN_DLY_SEL | <p>Since the GPMI write strobe (WRN) is a fast clock pin, the delay on this signal can be programmed to match the load on this pin.</p> <p>0 4ns to 8ns; 1 = 6ns to 10ns; 2 = 7ns to 12ns; 3 = no delay.</p> |
| 21 RSVD1 | Always write zeroes to this bit field. |
| 20 TIMEOUT_IRQ_EN | Setting this bit to '1' will enable timeout IRQ for transfers in ATA mode only, and for WAIT_FOR_READY commands in both ATA and Nand mode. The Device_Busy_Timeout value is used for this timeout. |
| 19 GANGED_RDYBUSY | Set this bit to 1 will force all Nand RDY_BUSY inputs to be sourced from (tied to) RDY_BUSY0. This will free up all, except one, RDY_BUSY input pins. |
| 18 BCH_MODE | This bit selects which error correction unit will access GPMI. This bit must always be set to '1', since only the BCH unit is available in this design. |
| 17 DLL_ENABLE | <p>Set this bit to 1 to enable the GPMI DLL. This is required for fast NAND reads (above 30 MHz read strobe).</p> <p>After setting this bit, wait 64 GPMI clock cycles for the DLL to lock before performing a NAND read.</p> |
| 16 HALF_PERIOD | Set this bit to 1 if the GPMI clock period is greater than 16ns for proper DLL operation. DLL_ENABLE must be zero while changing this field. |
| 15–12 RDN_DELAY | This variable is a factor in the calculated delay to apply to the internal read strobe for correct read data sampling. |

Table continues on the next page...

GPMI_CTRL1n field descriptions (continued)

| Field | Description |
|---|--|
| | <p>The applied delay (AD) is between 0 and 1.875 times the reference period (RP). RP is one half of the GPMI clock period if HALF_PERIOD=1</p> <p>otherwise it is the full GPMI clock period. The equation is: $AD = RDN_DELAY \times 0.125 \times RP$. This value must not exceed 16ns.</p> <p>This variable is used to achieve faster NAND access. For example if the Read Strobe is asserted from time 0 to 13ns but the read access time is 20ns,</p> <p>then choose AD=12ns will cause the data to be sampled at time 25ns (13+12) giving a 5ns data setup time. If RP=13ns then $RDN_DELAY = 12 / (0.125 \times 13ns)$</p> <p>= 7.38 (0111b). DLL_ENABLE must be zero while changing this field.</p> |
| 11 DMA2ECC_ MODE | This is mainly for testing HWECC without involving the Nand device. Setting this bit will cause DMA write data to redirected to HWECC module (instead of Nand Device) for encoding or decoding. |
| 10 DEV_IRQ | This bit is set when an Interrupt is received from the ATA device. Write 0 to clear. |
| 9 TIMEOUT_IRQ | This bit is set when a timeout occurs using the Device_Busy_Timeout value. Write 0 to clear. |
| 8 BURST_EN | When set to 1 each DMA request will generate a 4-transfer burst on the APB bus. |
| 7 ABORT_WAIT_ REQUEST | Request to abort "wait for ready" command on channel indicated by ABORT_WAIT_FOR_READY_CHANNEL. Hardware will clear this bit when abort is done. |
| 6-4 ABORT_WAIT_ FOR_READY_ CHANNEL | Abort a wait for ready command on selected channel. Set the ABORT_WAIT_REQUEST to kick off operation. |
| 3 DEV_RESET | <p>ENABLED = 0x0 NANDF_WP_B(WPN) pin is held low (asserted).</p> <p>DISABLED = 0x1 NANDF_WP_B(WPN) pin is held high (de-asserted).</p> <p>0 NANDF_WP_B pin is held low (asserted).</p> <p>1 NANDF_WP_B pin is held high (de-asserted).</p> |
| 2 ATA_IRQRDY_ POLARITY | <p>For ATA MODE:</p> <p>Note NAND_RDY_BUSY[3:2] are not affected by this bit.</p> <p>ACTIVELOW = 0x0 ATA IORDY and IRQ are active low, or NAND_RDY_BUSY[1:0] are active low ready.</p> <p>ACTIVEHIGH = 0x1 ATA IORDY and IRQ are active high, or NAND_RDY_BUSY[1:0] are active high ready.</p> <p>0 External ATA IORDY and IRQ are active low.</p> <p>1 External ATA IORDY and IRQ are active high.</p> <p>For NAND MODE:</p> <p>0 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when low and busy when high.</p> <p>1 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when high and busy when low.</p> |
| 1 CAMERA_MODE | When set to 1 and ATA UDMA is enabled the UDMA interface becomes a camera interface. |
| 0 GPMI_MODE | <p>ATA mode is only supported on channel zero.</p> <p>If ATA mode is selected, then only channel three is available for NAND use.</p> |

GPMI_TIMING0 field descriptions

| Field | Description |
|----------------------------|--|
| 31–24 RSVD1 | Always write zeroes to this bit field. |
| 23–16 ADDRESS_ SETUP | Number of GPMICLK cycles that the CE/ADDR signals are active before a strobe is asserted. A value of zero is interpreted as 0. For ATA PIO modes this is known in the ATA7 specification as "Address valid to DIOR-/DIOW- setup" |
| 15–8 DATA_HOLD | Data bus hold time in GPMICLK cycles. Also the time that the data strobe is de-asserted in a cycle. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as "DIOR-/DIOW- recovery time" |
| 7–0 DATA_SETUP | Data bus setup time in GPMICLK cycles. Also the time that the data strobe is asserted in a cycle. This value must be greater than 2 for ATA devices that use IORDY to extend transfer cycles. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as ""DIOR-/DIOW-" |

29.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1)

The GPMI timing register 1 specifies the timeouts used when monitoring the NAND READY pin or the ATA IRQ and IOWAIT signals.

GPMI_TIMING1 0x080

GPMI Memory Map/Register Definition

Address: 11_2000h base + 80h offset = 11_2080h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

GPMI_TIMING1 field descriptions

| Field | Description |
|------------------------------|--|
| 31–16 DEVICE_BUSY_TIMEOUT | Timeout waiting for NAND Ready/Busy or ATA IRQ. Used in WAIT_FOR_READY mode. This value is the number of GPMI_CLK cycles multiplied by 4096. |
| 15–0 RSVD1 | Always write zeroes to this bit field. |

29.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2)

The GPMI timing register 2 specifies the double data rate timing parameters that are used by the cycle state machine to guarantee the various cs delay, pre-amble delay, post-amble delay, command/address delay, data delay and read latency cycle times for the external media type.

GPMI_TIMING2 0x090

Address: 11_2000h base + 90h offset = 11_2090h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

GPMI_TIMING2 field descriptions

| Field | Description |
|-----------------------|--|
| 31–27 RSVD1 | Always write zeroes to this bit field. |
| 26–24 READ_LATENCY | This field is for double data rate read latency configuration. others READ LATENCY is 3 000 READ LATENCY is 0 001 READ LATENCY is 1 010 READ LATENCY is 2 011 READ LATENCY is 3 100 READ LATENCY is 4 101 READ LATENCY is 5 |

Table continues on the next page...

GPMI_TIMING2 field descriptions (continued)

| Field | Description |
|-----------------------------|--|
| 23–21 RSVD0 | Always write zeroes to this bit field. |
| 20–16 CE_DELAY | GPMI dealy from CEn assert to W/Rn changing edge. value of zero is interpreted as 32. |
| 15–12 PREAMBLE_ DELAY | GPMI pre-amble delay in GPMICLK cycles. A value of zero is interpreted as 16. |
| 11–8 POSTAMBLE_ DELAY | GPMI post-amble delay in GPMICLK cycles. A value of zero is interpreted as 16. |
| 7–4 CMDADD_ PAUSE | GPMI delay time from command or addres pause to command or address resume in GPMICLK cycles. A value of zero is interpreted as 16. |
| 3–0 DATA_PAUSE | GPMI delay time from data pause to data resume in GPMICLK cycles. A value of zero is interpreted as 16. |

29.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA)

The GPMI DMA data transfer register is used by the DMA to read or write data to or from the ATA/NAND control state machine.

GPMI_DATA 0x0A0

Address: 11_2000h base + A0h offset = 11_20A0h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31–16 APB_WORD_CNTR | Reflects the number of bytes remains to be transferred on the APB bus. |
| 15–0 DEV_WORD_CNTR | Reflects the number of bytes remains to be transferred on the ATA/Nand bus. |

29.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)

GPMI DDR Read Delay Loop Lock Control Register. This register provides programmability in DDR mode for data input timing and data formats.

GPMI_READ_DDR_DLL_CTRL 0x100

Address: 11_2000h base + 100h offset = 11_2100h

GPMI_READ_DDR_DLL_CTRL field descriptions

| Field | Description |
|---------------------------|---|
| 31–28 REF_UPDATE_INT | This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF_UPDATE_INT}) * \text{GPMICLK}$. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature) |
| 27–20 SLV_UPDATE_INT | Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state). |
| 19–18 RSVD1 | Reserved |
| 17–10 SLV_OVERRIDE_VAL | When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256. |
| 9 SLV_OVERRIDE | Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0 |
| 8 REFCLK_ON | set this bit to 1 will turn on the reference clock |
| 7 GATE_UPDATE | Setting this bit to 1, forces the slave delay line not update |
| 6–3 SLV_DLY_TARGET | The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from $(\text{GPMICLK}/2)/16$ to $\text{GPMICLK}/2$. |
| 2 SLV_FORCE_UPD | Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). |
| 1 RESET | Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again. |
| 0 ENABLE | Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled. |

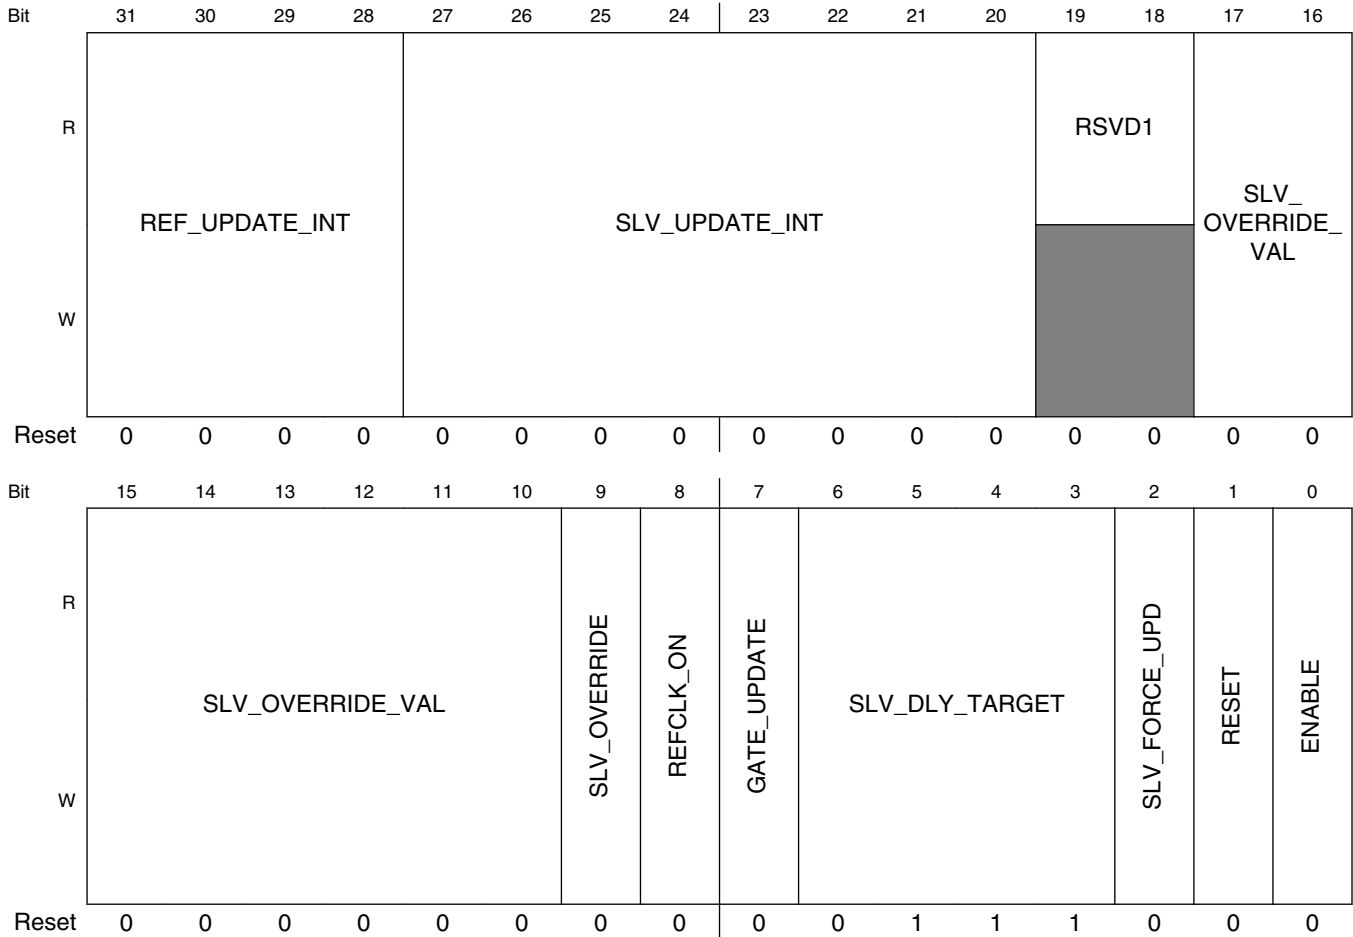

29.6.18 GPMI Double Rate Write DLL Control Register

Description (GPMI_WRITE_DDR_DLL_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI_WRITE_DDR_DLL_CTRL 0x110

Address: 11_2000h base + 110h offset = 11_2110h

Chapter 30

General Purpose Timer (GPT)

30.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO_CMPOUT n pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

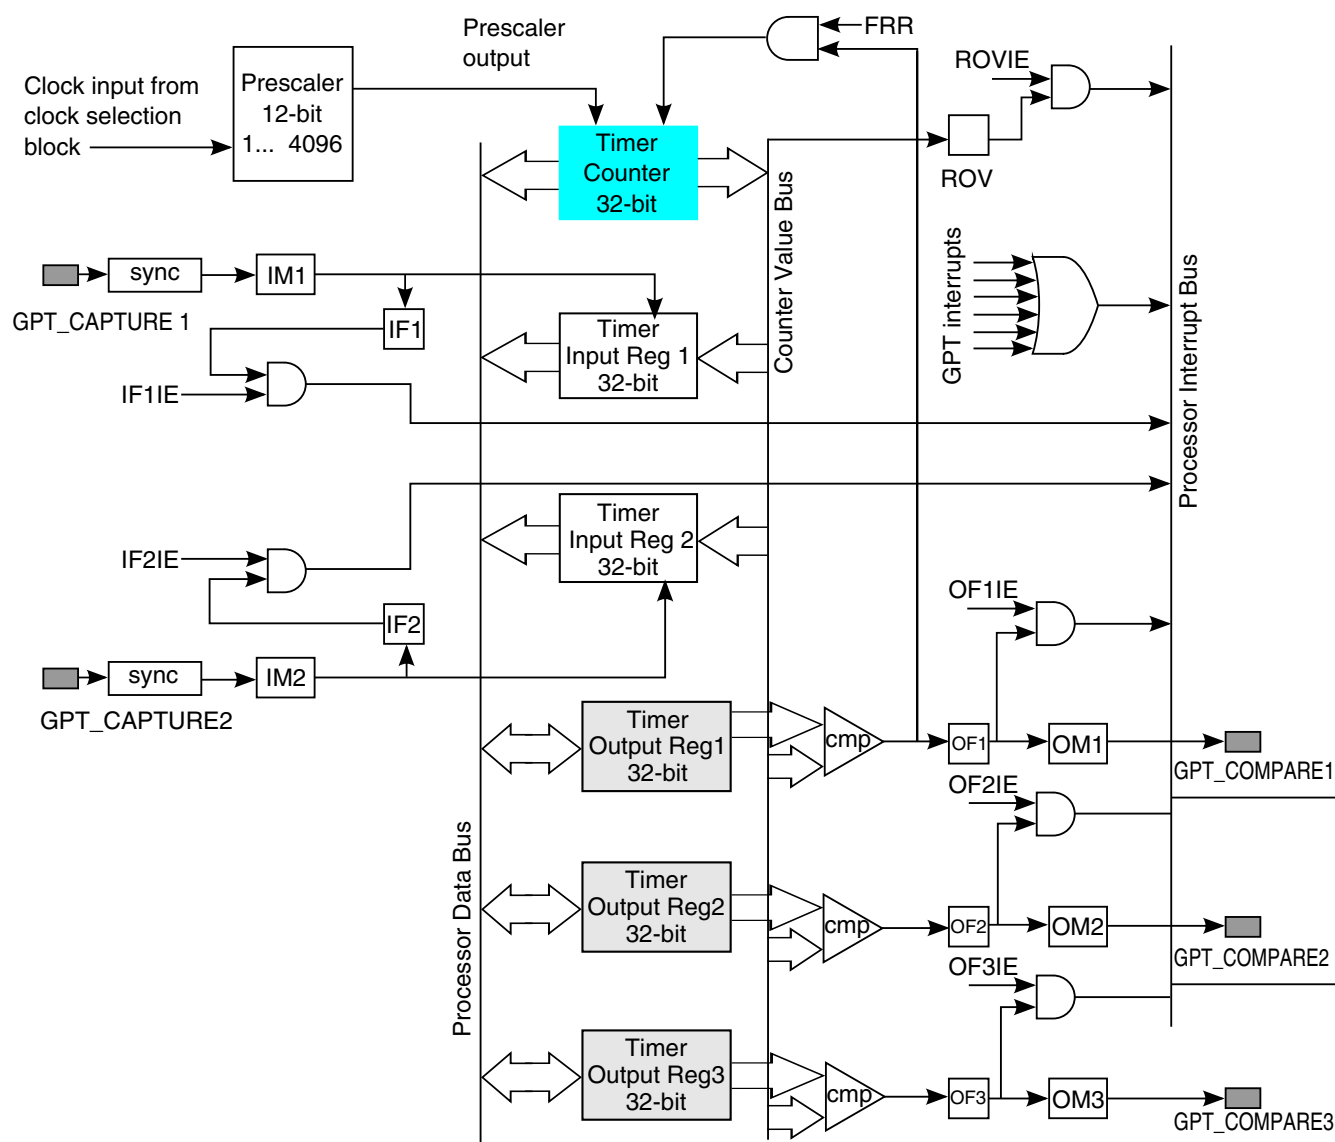

Figure 30-1. GPT Block Diagram

The following figure shows the GPT functional clocking scheme.

Figure 30-2. GPT Counter Clocks Diagram

30.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

30.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
 - [Restart Mode](#)
 - [Free-Run Mode](#)

30.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 30-1. GPT External Signals

| Signal | Description | Pad | Mode | Direction |
|--------------|---|----------|------|-----------|
| GPT_CLK | Input pin for an external clock that the counter can be operated at. | SD1_CLK | ALT3 | I |
| GPT_CAPTURE1 | Input pin for a capture event for Input Capture Channel 1. | SD1_DAT0 | ALT3 | I |
| GPT_CAPTURE2 | Input pin for a capture event for Input Capture Channel 2. | SD1_DAT1 | ALT3 | I |
| GPT_COMPARE1 | Output pin that indicates a "compare event" occurrence in Output Compare Channel 1. | SD1_CMD | ALT3 | O |
| GPT_COMPARE2 | Output pin that indicates a "compare event" occurrence in Output Compare Channel 2. | SD1_DAT2 | ALT2 | O |
| GPT_COMPARE3 | Output pin that indicates a "compare event" occurrence in Output Compare Channel 3. | SD1_DAT3 | ALT2 | O |

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

30.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

30.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

30.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

30.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 30-2. GPT Clocks

| Clock name | Clock Root | Description |
|------------------|--------------------|---------------------------------------|
| ipg_clk | ipg_clk_root | Peripheral clock |
| ipg_clk_32k | ckil_sync_clk_root | Low-frequency reference clock (32kHz) |
| ipg_clk_highfreq | perclk_clk_root | High-frequency reference clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

- High-Frequency Clock (ipg_clk_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

If the Peripheral Clock or the External Clock is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to $< 1/4$ frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

This 24MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24MHz Crystal Oscillator Clock is divided by a 24MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

Figure 30-3. Prescaler Value Change Timing Diagram

30.4 Functional Description

This section provides a complete functional description of the GPT.

30.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

30.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

30.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

30.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 30-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
 - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
 - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

30.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

Figure 30-4. Input Capture Event Timing

30.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

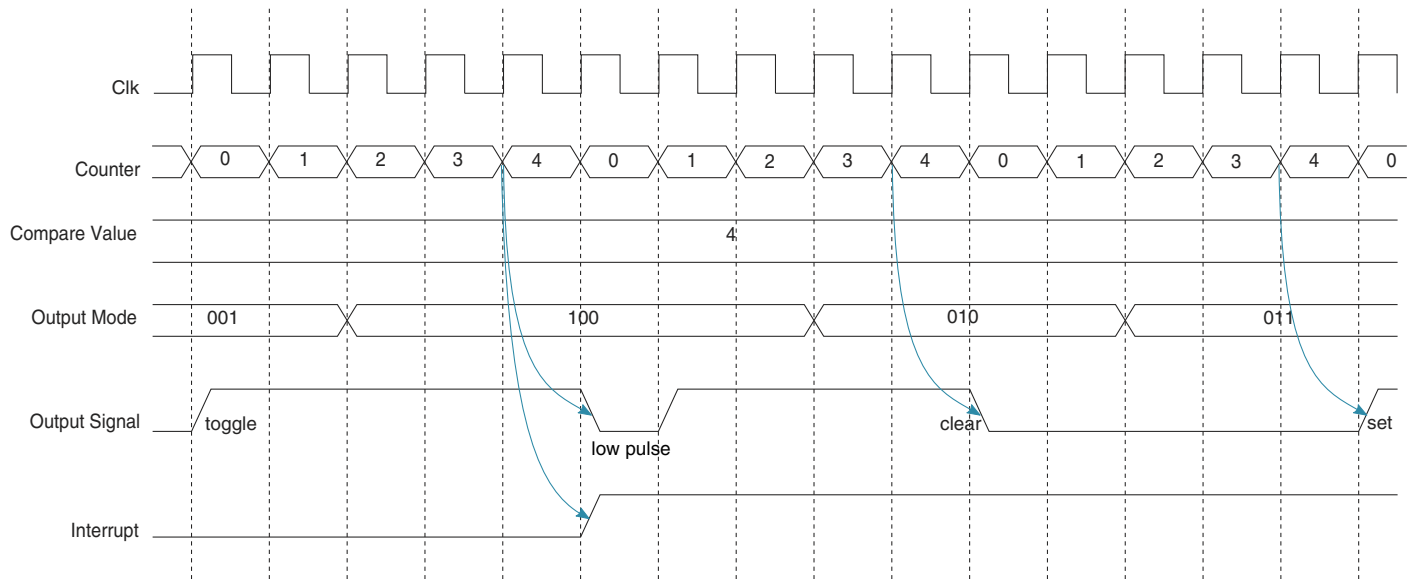

Figure 30-5. Output Compare and Interrupt Timing

30.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

30.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

30.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

30.5 Initialization/ Application Information

30.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

30.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

GPT memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 209_8000 | GPT Control Register (GPT_CR) | 32 | R/W | 0000_0000h | 30.6.1/1481 |

30.6.5 GPT Output Compare Register 1 (GPT_OCR1)

The GPT Compare Register 1 (GPT_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209_8000h base + 10h offset = 209_8010h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

GPT_OCR3 field descriptions

| Field | Description |
|--------------|---|
| 31–0 COMP | Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3. |

30.6.8 GPT Input Capture Register 1 (GPT_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209_8000h base + 1Ch offset = 209_801Ch

GPT_ICR1 field descriptions

| Field | Description |
|--------------|--|
| 31–0 CAPT | Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1. |

30.6.9 GPT Input Capture Register 2 (GPT_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209_8000h base + 20h offset = 209_8020h

GPT_ICR2 field descriptions

| Field | Description |
|--------------|--|
| 31–0 CAPT | Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2. |

30.6.10 GPT Counter Register (GPT_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209_8000h base + 24h offset = 209_8024h

GPT_CNT field descriptions

| Field | Description |
|---------------|---|
| 31–0 COUNT | Counter Value. The COUNT bits show the current count value of the GPT counter. |

Chapter 31

2D Graphics Processing Unit (GPU2D)

31.1 Overview

The R2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The V2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The GPU2D cores provide powerful graphics at low power consumption, utilizing the smallest silicon footprints. Dynamic power consumption is minimized by extensive use of localized clock gating.

R2D GPU Hardware acceleration is brought to numerous 2D including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU R2D block diagrams is presented in the [Figure 31-1](#).

V2D GPU Hardware acceleration is brought to numerous VG applications including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU V2D block diagrams is presented in the [Figure 31-2](#).

31.2 GPU2D Block Diagram

31.2.1 R2D GPU

The R2D graphics processing unit (GPU) defines a high-performance 2D raster graphics core that accelerates the 2D graphics display.

R2D GPU supports acceleration of the following graphics APIs:

- DirectFB (on Linux)
- GDI/DirectDraw (on Windows CE)

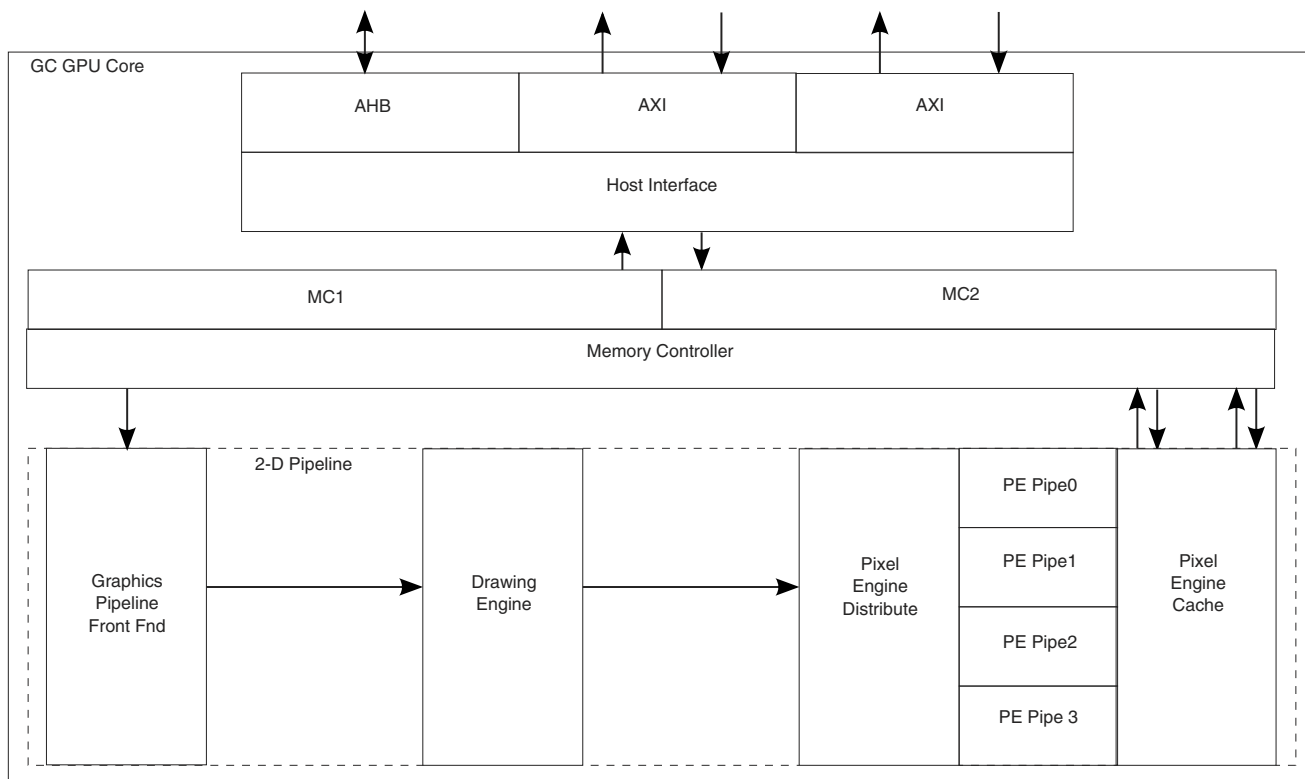

Figure 31-1. R2D GPU Block Diagram

31.2.2 V2D GPU

V2D GPU defines a high-performance graphics core designed for hardware acceleration of OpenVG vector graphics display. V2D GPU is designed for easy integration onto the SoC.

V2D GPU supports the following graphics APIs:

- OpenVG 1.1

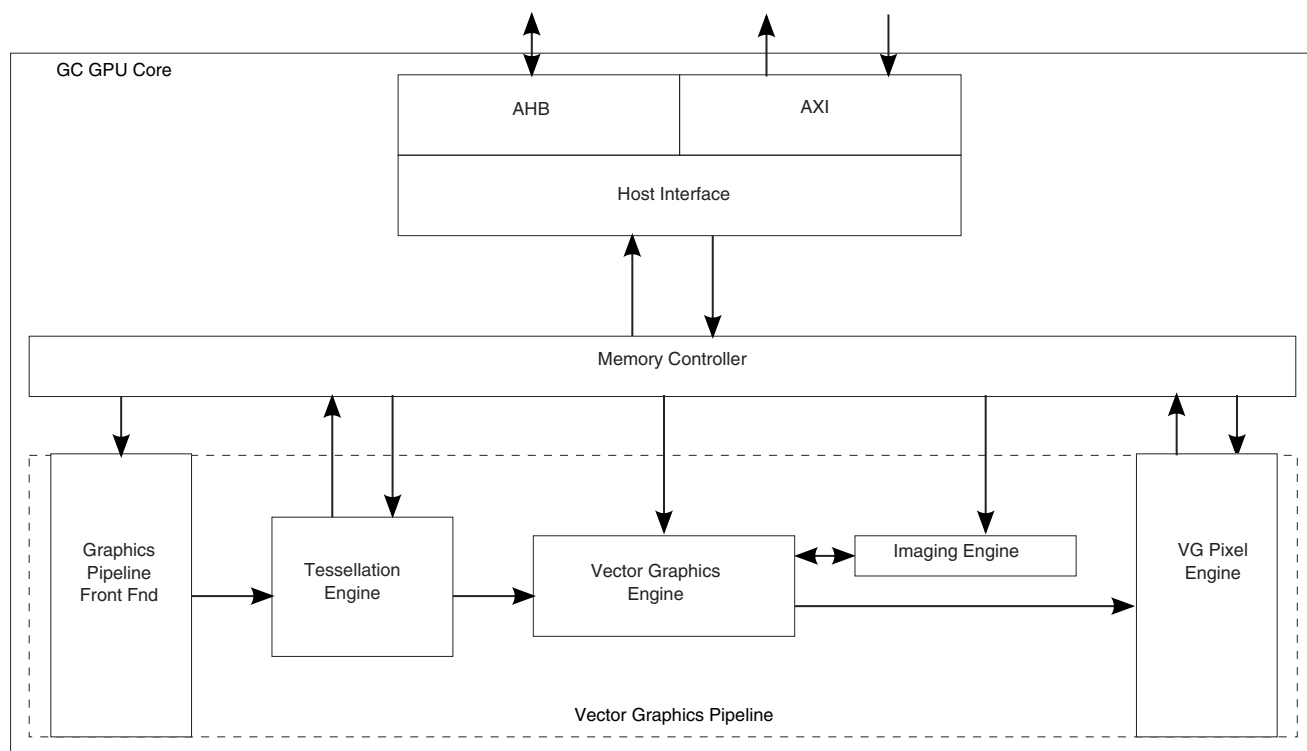

Figure 31-2. V2D GPU Block Diagram

31.3 GPU2D Features

The following sections describe the functional features of the R2D and V2D GPU.

31.3.1 Full Featured R2D GPU Pipeline

- Bit BLT
- Stretch BLT
- Rectangle fill and clear
- Line drawing
- Filter BLT
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending, including Java 2 Porter-Duff compositing blending rules
- 32K x 32K coordinate system
- 90 / 180 / 270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask

31.3.2 Full Featured V2D GPU Pipeline

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint(gradient and pattern)
- Blending
- Higher-level Geometric Primitives
- Image Warping

31.4 GPU2D OPERATIONS

31.4.1 R2D GPU Operations

Information detailing the R2D GPU operations can be found [here](#).

31.4.1.1 Line

The LINE operation draws a line. Coordinates for two points are given: start point and end point. The end point is not drawn.

Lines are rendered using the Bresenham algorithm. The Bresenham algorithm has the advantage of using integer arithmetic and has no accumulation of rounding errors. In the case of line, only ROP2 and ROP4 are supported. It operates on pattern and destination. The pattern should have a transparency mask in order to use ROP4.

Clipping is supported for lines on a per pixel basis.

Figure 31-3. Line

31.4.1.2 Rectangle Fill and Clear

Rectangle fill creates a rectangle area with a given color. Essentially rectangle fill is a pattern fill, where an 8x8 pattern is initialized with the specified color. It supports ROP2 and ROP4 with the pattern and destination as its inputs. If ROP4 is used, the pattern should have a transparency mask.

Clear is similar to rectangle fill except that it does not use a pattern. A 32-bit clear value with 4-bit byte mask is used to fill the entire rectangle area.

Both rectangle fill and clear support clipping, which is performed on a per primitive basis.

31.4.1.3 BitBLT

Bit blit transfers data from one area of a memory (source) to another area of the memory (destination).

The source and destination can be from the same or different memory locations. Both source and destination must be described by a rectangular area. The source and destination rectangles can be the same size (most bit blits are of this nature) or they can be different sizes, in which case the operation becomes a stretch or shrink blit.

Bit blit supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color.

Clipping can be performed on a primitive basis.

Figure 31-4. BitBLT

The BIT BLT primitive supports the following 10 source and 8 destination image formats:

Table 31-1. Bit BLT Formats

| Formats | Source Image | Destination Image |
|-------------------|--------------|-------------------|
| A1R5G5B5 | Yes | Yes |
| A4R4G4B4 | Yes | Yes |
| X1R5G5B5 | Yes | Yes |
| X4R4G4B4 | Yes | Yes |
| R5G6B5 | Yes | Yes |
| A8R8G8B8 | Yes | Yes |
| X8R8G8B8 | Yes | Yes |
| A8 | Yes | Yes |
| 1-bit monochrome | Yes | No |
| 8-bit color index | Yes | No |

31.4.1.4 Stretch BLT

The STRETCH BLT primitive performs a BitBlt operation with stretch or shrink. The modified Bresenham algorithm is used to generate corresponding coordinates for fast stretching.

The stretch factor is specified in a 15.0 fixed-point format. Stretch blit is not allowed to overlap therefore no part of source and destination can share any piece of memory. Non-stretch blits can overlap. For stretch blit, clipping is performed on a per pixel basis.

31.4.1.5 Monochrome Expansion and Mask BLT

Monochrome expansion and mask blit are different operations, although both use the bit stream from command buffer and both can be the source for ROP4 source selection. This means that each output pixel can be a combination of source, pattern, monochrome mask (for masked blits) and destination.

31.4.1.5.1 Monochrome expansion

For monochrome expansion, the bit from the stream is used to switch on/off a solid color that is defined in a register. This mechanism enables the use of just one bit per pixel to represent colors. In effect, the MONO EXPANSION primitive increases color representation from one bit per pixel to multiple bits per pixel. A typical application for mono color is font drawing.

Monochrome expansion does not support overlapping of the source and destination. It is the responsibility of the driver to make sure that the command will never be executed with overlapping source and destination.

31.4.1.5.2 Mask BLT

For Mask BLT, the bit from the stream is used to toggle on/off a color in the source frame buffer. Mask BLT takes its color source from memory and its monochrome mask from the command stream. Clipping is supported and is performed on a per pixel basis.

31.4.1.6 Filter BLT

Filter blit performs high quality scaling, up or down, using an FIR re-sampling filter with up to 9 taps. Sub-pixel coordinates (locations between the pixel grids) are generated by the drawing engine. The filter block in the drawing engine uses the sub-pixel information to select the appropriate filter kernel. R2D GPU processes 1 pixel every cycle when performing filter blit.

A stretch- or shrink-factor of 15.16 fixed-point format is supported. To generate a single destination pixel requires 9 source pixels. An image is scaled in two passes, one for X-dimension (HOR_FILTER_BLT) and the other for Y-dimension (VER_FILTER_BLT). Software sets up the filter kernel/coefficient table and the kernel size, as well as a temporary buffer for storing intermediate results. After the first pass is completed, intermediate results are sent back to memory, and then the second pass starts to scale the first-pass image. Because of this two-step procedure, the throughput of FILTER BLT is lower than that of STRETCH BLT. Also the Filter Kernel Table may need to be reloaded, and some cycles are consumed in calculating the stepping parameters.

When the stretch or shrink factor is 1, the filterBlit works as a bitBlit copy. It can be used as format converter in that case, for instance, YUV to RGB converter. To use as a format converter, only one pass (HOR_FILTER_BLT or VER_FILTER_BLT) is needed. To optimize the memory bandwidth, when using filterBlit to do YUV to RGB filtering, the temporary target buffer format can be specified as YUY2 to process Y-dimension filtering (VER_FILTER_BLT). This is to avoid converting YUV to A8R8G8B8 in the 1st vertical pass to reduce the memory bandwidth and increase the pixel processing rate. This is the only special case that GPU may use YUY2 as target format.

The FILTER BLT primitive supports the following 13 source and 7 destination image formats:

Filter BLT Formats

| Formats | | Source Image | Destination Image |
|----------|--------------------------|--------------|-------------------|
| A1R5G5B5 | | Yes | Yes |
| A4R4G4B4 | | Yes | Yes |
| A8R8G8B8 | | Yes | Yes |
| R5G6B5 | | Yes | Yes |
| X1R5G5B5 | | Yes | Yes |
| X4R4G4B4 | | Yes | Yes |
| X8R8G8B8 | | Yes | Yes |
| YUV | NV12 (4:2:0, 2 planes) | Yes | No |
| | NV16 (4:2:2, 2 planes) | Yes | No |
| | UYVY (4:2:2, interleave) | Yes | No |
| | YUY2 (4:2:2, interleave) | Yes | No |
| | YV12 (4:2:0, 3 planes) | Yes | No |
| | 8-bit color index | Yes | No |

31.4.1.7 R2D Performance of different operations

Table 31-2. Performance of different operations without rotation

| Primitive | Peak Performance | Source/destination overlap | Clipping |
|----------------------|-------------------|----------------------------|-------------------------|
| Line | 1 pixel / cycle | N/A | Done on pixel basis |
| Rectangle | 2.4 pixel / cycle | N/A | Done on primitive basis |
| Clear | 2.4 pixel / cycle | N/A | Done on primitive basis |
| Blit | 2.4 pixel / cycle | Overlap is allowed | Done on primitive basis |
| Stretch blit | 1 pixel / cycle | No overlap allowed | Done on pixel basis |
| Monochrome expansion | 1.6 pixel / cycle | No overlap allowed | Done on pixel basis |
| Filter blit | 1 pixel / cycle | N/A | N/A |

Table 31-3. Performance of different operations with rotation

| Primitive | Performance | Source/destination overlap | Clipping |
|----------------------|-----------------|----------------------------|-------------------------|
| Line | 1 pixel / cycle | N/A | Done on pixel basis |
| Rectangle | 2 pixel / cycle | N/A | Done on primitive basis |
| Clear | 2 pixel / cycle | N/A | Done on primitive basis |
| Blit | 2 pixel / cycle | Overlap is allowed | Done on primitive basis |
| Stretch blit | 1 pixel / cycle | No overlap allowed | Done on pixel basis |
| Monochrome expansion | 1 pixel / cycle | No overlap allowed | Done on pixel basis |
| Filter blit | 1 pixel / cycle | N/A | N/A |

31.4.1.8 Rotation

90° / 180° / 270° / X-Flip / Y-Flip / Mirror rotation is supported for all primitives.

31.4.1.9 Transparency Mode

For monochrome expansion:

- Opaque
- Conditional transparency. Transparent if the current pixel matches the specified value.

For blits:

- Opaque
- Masked transparency. Transparent if the mask for the current pixel or pattern is zero.
- Source Conditional transparency. Transparent if the source pixel is within the specified value range.
- Destination Conditional transparency. Transparent if the destination pixel is not within the specified value range.

31.4.1.10 Clipping

One clipping rectangle is supported for all bitBlit primitives.

31.4.1.11 R2D GPU Data Formats

The graphics engine supports 14 source data formats. In addition to these 14 source formats, for RGB source formats, GPU also supports their swizzle formats (ARGB, RGBA, ABGR, BGRA) for RGB formats. For YUV formats, GPU supports their U/V swap formats.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8
- NV12
- NV16
- UYVY (4:2:2)
- YUY2 (4:2:2)
- YV12 (4:2:0)
- 8-bit color index

There are 8 destination data formats supported by the graphics engine. In addition to these destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8

31.4.1.12 ARGB Data Conversion of R2D GPU

The pixels read from source or destination will be expanded into A8R8G8B8 format internally to maintain lossless pixel operations. The resulting pixels will be converted into the destination format.

31.4.1.13 YUV to RGB Conversion of R2D GPU

YUV data can be converted into 8-bit per component RGB format at the output of the cache only. Once converted, there is no way back to YUV format. GPU supports BT.601 and BT.709 YUV to RGB color conversion standards.

In BT.601, the YUV to RGB conversion is done using the following approximation:

$$16 \leq Y \leq 235$$

$$16 \leq U \leq 240$$

$$16 \leq V \leq 240$$

$$A = Y - 16$$

$$B = U - 128$$

$$C = V - 128$$

$$R = \text{clip}((298 * A + 410 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 101 * B - 209 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 519 * B + 128) \gg 8)$$

The Y, U and V components are clamped prior to the conversion.

Y is clamped between 16 and 235, inclusively.

U and V are clamped between 16 and 240, inclusively.

In BT.709, the R, G, B equations are slightly changed to

$$R = \text{clip}((298 * A + 461 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 55 * B - 137 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 543 * B + 128) \gg 8)$$

31.4.1.14 Color Index Input Conversion Support of R2D GPU

Color index is supported for source data only. A look-up table with 256 entries is provided for indexing the data. The table is fully programmable. The conversion is done when pixels are read out of the cache.

31.4.1.15 Source/Destination Pre-multiply and De-Multiply Support

GPU supports source pre-multiply source alpha or global alpha, or source global color for global colorizing. On destination, the GPU supports destination pre-multiply destination alpha, destination de-multiply alpha.

31.4.1.16 Alpha Blending

The GPU supports alpha blending together with ROP. The alpha blending function is performed on ROP function result source.

The general alpha blending equations are:

$$Cd = Fs * Cs' + Fd * Cd'$$

$$Ad = Fs * As'' + Fd * Ad''$$

Where

- Cs' is the source color component (adjusted for NPM if necessary)
- Cd' is the destination color component (adjusted for NPM if necessary)
- As'' is the modified source alpha component
- Ad'' is the modified destination alpha component
- Fs is fraction of the source that contributes to the final value
- Fd is fraction of the destination that contributes to the final value

The blending is done in 5 logical stages (not real implementation stages):

1. Transparent/opaque conversion
 - In this stage, the incoming alpha (source or destination independently) can be inverted if needed to match the internal alpha rule. Internally, an alpha of 0 means transparent, while an alpha of "0xFF" means opaque. External content might follow the opposite rule. The output of the block is either As (Ad for destination) or 1-As (1-Ad for destination).
2. Global value substitution
 - A global alpha value from a register can be used to substitute or scale the incoming alpha. An incoming alpha As can pass-through, be directly substituted by Ags (global alpha) or scaled by the global alpha value (As * Ags). The source and destination have distinct global alpha values.
3. Blending factor generation
 - At this stages, the blending factors are generated (refer to table below). Each alpha can take the values 0, 1, A or 1-A depending on the blending mode.
4. Final blending
 - This is the final stage which implements blending equations.

The fractions take the values described in the following table, depending on the blending mode.

Table 31-4. Blending Modes Fractions Description

| Blending Mode | Fs | Fd |
|---------------|-------------|-------------|
| Clear | 0 | 0 |
| SRC | 1 | 0 |
| DST | 0 | 1 |
| SRC_OVER | 1 | $1 - A_s''$ |
| DST_OVER | $1 - A_d''$ | 1 |
| SRC_IN | A_d'' | 0 |
| DST_IN | 0 | A_s'' |
| SRC_OUT | $1 - A_d''$ | 0 |
| DST_OUT | 0 | $1 - A_s''$ |
| SRC_ATOP | A_d'' | $1 - A_s''$ |
| DST_ATOP | $1 - A_d''$ | A_s'' |
| XOR | $1 - A_d''$ | $1 - A_s''$ |

To control the blending modes, the following register fields are used:

- 1 bit for transparent/opaque conversion for source alpha
- 1 bit for transparent/opaque conversion for destination alpha
- 2 bits for source alpha modifications, to specify the 3 cases (A_s , A_g , $A_s * A_g$)
- 2 bits for destination alpha modifications, to specify the 3 cases (A_d , A_g , $A_d * A_g$)
- 4 bits to select between the 12 blending modes
- 8-bits for global source alpha
- 8-bits for global destination alpha

Alpha blending is supported on bit blit and filter blit primitives.

31.4.1.17 GPU Cache Management

SW cache flush is supported to flush the GPU cache to memory. Auto-flush of GPU cache is also supported. SW sets up the auto-flush interval, and HW will do the cache flush automatically at programmable intervals.

31.4.2 V2D GPU Operations

Information detailing the V2D GPU operations can be found [here](#).

31.4.2.1 OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION

OpenVG is a royalty-free, cross-platform API managed by the member-funded consortium known as Khronos Group. It provides a low-level hardware acceleration interface for vector graphics libraries such as Flash and SVG. OpenVG is used for acceleration of high-quality vector graphics for user interfaces and text on small screen devices.

31.4.2.2 Advantages of Using OpenVG

- Hardware accelerators can reduce power consumption by up to 90% compared to a software engine.
- Scalability with high-quality rendering, including anti-aliasing, to different screen sizes without multiple bitmaps.

31.4.2.3 OpenVG Target Applications

- SVG Viewers
- Portable Mapping Applications
- E-book Readers
- Games
- Scalable User Interface

31.4.2.4 OpenVG Features

31.4.2.4.1 Core API

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint (gradient and pattern)
- Blending
- Dithering

31.4.2.4.2 The VGU Utility Library

- Higher-level Geometric Primitives
- Image Warping

31.4.2.4.3 OpenVG Rendering Pipeline

- Stage 1: Path, Transformation, Stroke, and Paint
- Stage 2: Stroked Path Generation
- Stage 3: Transformation
- Stage 4: Rasterization
- Stage 5: Clipping and Masking
- Stage 6: Paint Generation
- Stage 7: Image Interpolation
- Stage 8: Blending and Anti-aliasing

Chapter 32

3D Graphics Processing Unit (GPU3D)

32.1 Overview

The GPU3D is a high-performance core that delivers hardware acceleration for 3D graphics display.

Addressable screen sizes range from the smallest cell phones to HD 1080p displays. It provides high performance, high quality graphics, low power consumption, and the smallest silicon footprint.

GPU3D accelerates numerous 3D graphics applications, including graphical user interfaces (GUI), menu displays, flash animation, and gaming. This module supports the following graphics APIs:

- OpenGL ES 2.0
- OpenGL ES 1.1
- OpenVG 1.1
- EGL 1.4
- DirectX 11_9_3
- OpenGL 2.1 and 3.0
- OpenCL 1.1 E

32.2 GPU3D Block Diagram

The main functional units of the GPU3D are shown in the figure below and their description is as follows:

- Host Interface: Allows GPU3D to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- Memory Controller: Internal memory management unit that is the block-to-host memory request interface.

- **Graphic Pipeline Front End:** Inserts high level primitives and commands into the graphics pipeline.
- **Ultra-threaded Unified Shader:** SIMD processor that performs as both vertex shader and fragment shader. When used as a vertex shader it performs geometry transformations and lighting computations. When used as a fragment shader it applies texture data and computes color values for each pixel. GPU3D has four (4) such shaders.
- **3D Rendering Engine:** Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.
- **Texture Engine:** Retrieves texture information from memory upon request by the fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader or the vertex shader. GPU3D has 2 texture units.
- **Pixel Engine/Resolve:** Pixel engine does alpha blending and visible surface determination. Resolve does tiling and de-tiling as well as FSAA filtering. GPU3D has two 2 pixel units.

GC GPU CORE

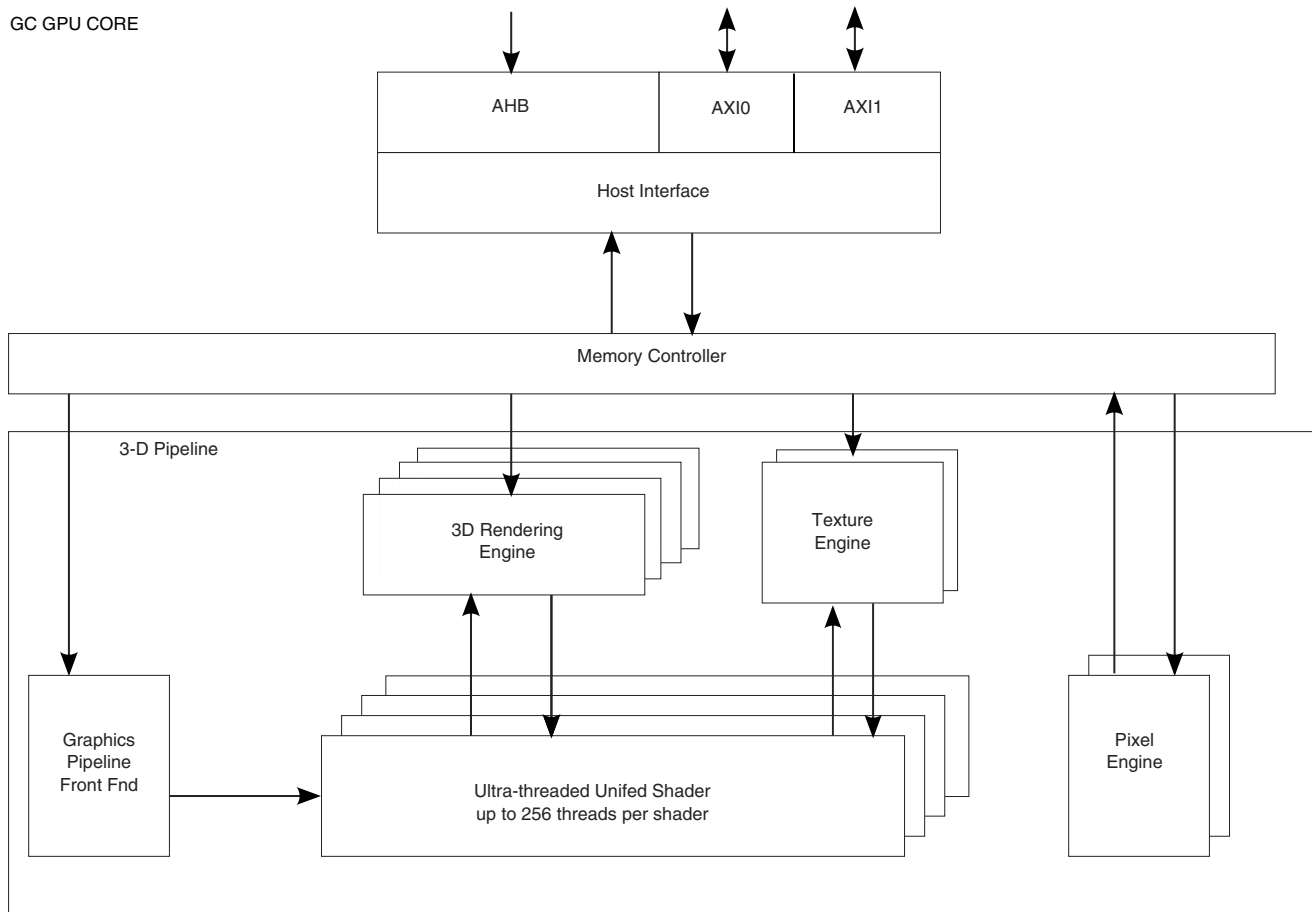

Figure 32-1. GPU3D Top Level Block Diagram

There are two main clocks for the processing control: shader clk for the shader part, and core clk for the remaining part. The core clk and shader clk frequency are programmable in CCM (as the clk frequency for GPU3D_CORE_CLK_ROOT, GPU3D_SHADER_CLK_ROOT).

The GPU3D provides architectural support for the following features:

Table 32-1. GPU3D Architectural Support

| Feature | GPU Support |
|--|--|
| Primary API | OpenGL ES1.1 and 2.0, Haili, OpenCL1.1 |
| Additional API's | OpenVG1.1 |
| | OpenGL |
| | OpenCL |
| Other Graphics Support | EGL1.4 |
| Drivers | OpenGL ES1.1 and Haili |
| | OpenVG1.1 |
| | EGL1.4 |
| | OpenGL2.1 and 3.0 |
| | OpenCL1.1 EP |
| Operating Systems | Windows CE |
| | Linux Embedded |
| | Android |
| Z (depth) | Early Z support included |
| Stencil | Early stencil support included |
| Shader Languages | GLSL ES 1.0 |
| Shader model compatability | Shader model 3.0 |
| Shader types and execution units | Four programmable Scalable Ultra-threaded Unified Shaders (SIMD4:transcendental,ctl-flow,tx-load) one instruction issue per shader per clock; IEEE 32-bit floating-point pipeline supports long shader instructions |
| FSAAs anti-aliasing mechanisms | High quality MSAA 4x; MSAA 16x for OpenVG |
| Code and data memory location restrictions | Unrestricted; arbitrary memory reads and writes |
| Physical address | 31 bits |
| MMU description | 32-bit virtual address, 4 kB pages, error reporting outside of address space |
| TLB | 4 cache lines per requestor |
| Resource locks with CPU | Semaphore lock |
| Max memory latency without a performance hit | 256 GPU cycles |

32.3 GPU3D Hardware Features

The GPU3D block has the following hardware features:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 16 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 16 fragment shader simultaneous textures
- Support for 16 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target
- 8 Vertex DMA streams
- 2 texture units and 2 pixel units for higher pixel processing rate

Table 32-2. Unified vertex-fragment shader features

| Feature | GPU Support |
|--|--|
| Shader type and execution units | Four (4) unified shaders, SIMD4, SFP32 Trans |
| Swizzle capabilities | Full 32-bit word level swizzle in a 128-bit vector |
| GPR's per shader | Up to 512 general purpose registers, 128 bits each |
| Uniform registers | Vertex Shader: 168 registers, 128 bits each Fragment Shader: 64 registers, 128 bits each |
| FP denorm and rounding options | Denorms are set to zero. Supports rounding to zero. |
| Maximum number of data input attributes | Maximum of 16 vertex shader input elements; maximum of 12 fragment shader input elements; |
| Maximum number of instructions | 512 unified for both vertex and fragment shaders |
| Maximum number of vertex streams | 8 |
| Maximum number of threads in flight per shader | 256 |
| Subroutines | 4 levels |
| Conditional branch support | GT, LT, EQ, GE, LE, NE, ISNAN, ISFINITY, ISINFINITY, ISNORMAL, AND, OR, XOR, NOT, ANYMSB, ALLMSB, SELMSB |
| Shader instruction rate | 1-cycle throughput for all shader instructions |
| Floating-point instruction precision | Transcendental: 22 bits SIMD4 (vector): 23.5 bits |
| Fragment shader video | Supports video texture |

Table continues on the next page...

Table 32-2. Unified vertex-fragment shader features (continued)

| Feature | GPU Support |
|---------------------------|--|
| Control flow instructions | Yes |
| Standard derivatives | Yes |
| Integer pipeline | Support 8, 16, 32-bit integer operations |
| Local shared memory | 1 kB |
| L1 Cache | 4 kB |

Table 32-3. Vertex Processing Features

| Feature | GPU Support |
|----------------------------------|--|
| Vx D3D, OGL ES formats supported | BYTE, UBYTE, SHORT, USHORT, INT, UINT, DEC, UDEC, FLOAT, FLOAT16, D3DCOLOR, FIXED16DOT16, R10B10G10A02 |
| Vertex data size limits | 256 bytes |
| Pre shader cache | 2 kB |
| Post shader cache | 8/16 vertices |

Table 32-4. Primitive Processing Features

| Feature | GPU Support |
|---|--|
| Primitives supported | triangle strip, fan, and list; line strip and list; point list |
| Vertex/primitive geometry input index sizes | 8-bit , 16-bit and 32-bit indices |
| Setup parameters available to fragment shader | 12 vec4 parameters; all available to fragment shader |
| Primitive restart | Yes |

Table 32-5. Texture Processing Features

| Feature | GPU Support | | | | | | | | | |
|--|--|--|----------|--------------|---|---|---|----|------|------|

| | 32 | RGB10_a2ui | | 10 | 10 | 10 |
| Blend modes | Porter-Duff blending modes | | | | | |
| Render target dithering support | Yes | | | | | |

32.3.4 Z/Stencil Buffer

Table 32-9. Z/Stencil Buffer Features

| Feature | GPU Support |
|---------------------------------------|--|
| Z/stencil formats | 16-bit Z; 24-bit Z plus 8-bit stencil, with lossless compression support |
| Z/stencil buffer | 32 cache lines; 64 bytes per line; |
| Z compression | Yes, 30% - 70% |
| Stencil compression | Yes |
| Fast clear and initialization options | Yes |

32.3.5 Render Target

| Feature | GPU Support |
|---------------------------------------|--|
| Formats | 16-bit and 32-bit, with lossless compression support |
| RT buffer cache | 32 cache lines; 64 bytes per line; RT caches are fully set associative. |
| Compressed formats | Yes, 30% - 70% |
| Fast clear and initialization options | Yes |
| Multi-Render Target support | 4 Targets |

32.4 Usage Mode

The GPU3D should be programmed through the Freescale provided driver. Freescale does not provide support for software that directly programs the GPU3D registers. APIs for programming the GPU3D through the software driver are described in separate driver documentation.

Chapter 33

HDMI Transmitter (HDMI)

33.1 Overview

33.1.1 HDMI Operational Model Overview

The High Definition Multimedia Interface (HDMI) is a wired digital interconnect that replaces the analog TV out or VGA out.

HDMI is capable of transferring uncompressed video, audio, and data using a single cable. The video pixel rates are typically from 25 MHz up to 266 MHz (and 3D video modes), but HDMI can support higher rates up to 266 MHz. It can support S/PDIF (IEC60958 L-PCM and IEC61937 compressed non-linear PCM: AC-3, MPEG-1/-2 Audio, DTS®, MPEG-2/-4 AAC, ATRAC, WMA, MAT) and Parallel HBR (high bit rate) audio interface, enabling the support of Dolby® True-HD and DTS-HD Master Audio. HDMI has the capability of automatically setting the display format configuration (intelligent link).

HDMI include a content protection system called HDCP (High-bandwidth Data Content Protection). The HDMI connections can be used to connect DVD recorders, set-top boxes, and game consoles to flat panel televisions and an AV amplifier that can act as repeater/router.

HDMI system architecture consists of sources (transmitter) and sinks (receiver). As shown in the figure below, the HDMI cable and connectors carry four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA Data Display Channel (DDC). The DDC is used for configuration and status exchange between a single source and a single sink. The optional CEC protocol provides high-level control functions between all of the various audiovisual products in a user's environment.

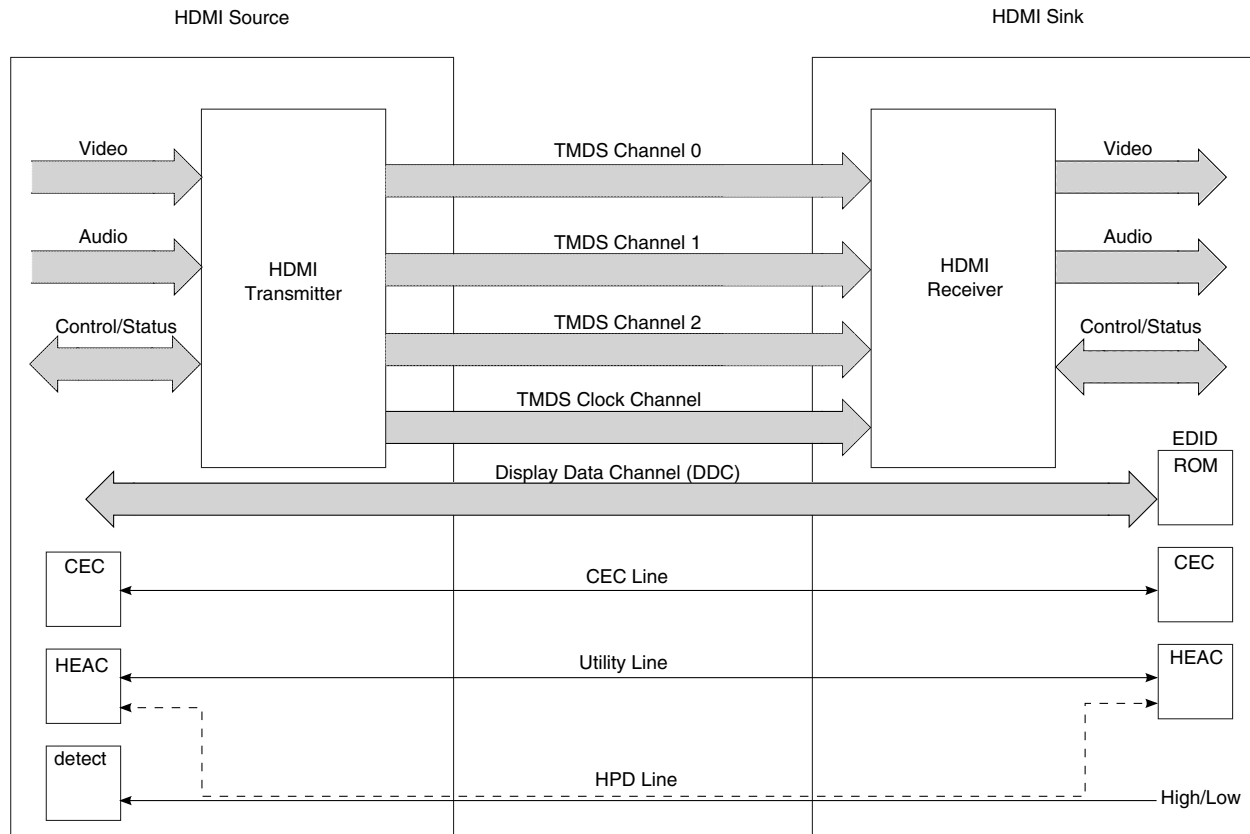

Figure 33-1. HDMI Block Diagram

Audio, video, and auxiliary data is transmitted across the three TMDS data channels. A TMDS clock running at 1x (24-bit true color mode), the video pixel rate is transmitted on the TMDS clock channel and used by the receiver as a frequency reference for data recovery on the three TMDS data channels. Video data can have a pixel size of 24bits . Video at the default 24-bit color depth is carried at a TMDS clock rate equal to the pixel clock rate. Higher color depths are carried using a correspondingly higher TMDS clock rate. Video formats with TMDS rates below 25MHz (such as, 13.5MHz for 480i/NTSC) can be transmitted using a pixel-repetition scheme. The video pixels can be encoded in either RGB, YCBCR 4:4:4, or YCBCR 4:2:2 formats.

HDMI uses a packet structure to transmit audio and auxiliary data across the TMDS channels. To attain the highest reliability required of audio and control data, this data is protected with a BCH error correction code and is encoded using a special error reduction code to produce the transmitted 10-bit word.

Basic audio functionality consists of a single IEC 60958 L-PCM audio stream (two audio channels) at sample rates of 32 KHz, 44.1 KHz, or 48 KHz, which can accommodate any normal stereo stream. Optionally, HDMI can carry audio at sample rates up to 192KHz

and with three to eight audio channels. HDMI can also carry an IEC 61937 compressed (such as, surround sound) audio stream at bit rates up to 24.576 Mbps. For bit rates above 6.144 Mbps, compressed audio streams conforming to IEC 61937 are carried using HBR Audio Stream Packets. Each packet carries four IEC 60958 frames, which corresponds to $(4 \times 2 \times 16 =)$ 128 contiguous bits of an IEC 61937 stream.

The source uses the DDC to read the sink's Enhanced Extended Display Identification Data (E-EDID) to obtain the sink's configuration and/or capabilities.

The HDMI TX Controller schedules the three periods: Video Data Period, Data Island period, and Control period. During the Video Data Period, the active pixels of an active video line are transmitted. During the Data Island period, audio and auxiliary data are transmitted using a series of packets. The Control period is used when no video, audio, or auxiliary data needs to be transmitted. A Control Period is required between any two periods that are not Control Periods.

An example of each period placement is shown in the figure below.

Figure 33-2. TMDS Periods in 720x480p Video Frame

33.1.1.1 Interfaces

HDMI TX has the following interfaces:

- HDCP interface
- External ROM interface for key storage
- External RAM interface for revocation
- Random number generator interface
- Video input interface
- RGB 4:4:4
- YCbCr4:2:2
- YCbCr4:4:4
- Digital audio input interface
- AHB audio DMA
- System interface
- AMBA AHB
- Scan test interface
- HDMI TX PHY interface
- CEC interface

33.1.1.2 Features

HDMI TX includes the following features:

- Supported video formats:
- All CEA-861-E video formats up to 1080p at 60Hz and 720p/1080i at 120Hz
- Supported colorimetry:
- 24bit RGB 4:4:4
- 24bit YCbCr 4:4:4
- 16bit YCbCr 4:2:2
- xvYCC601
- xvYCC709
- Integrated color space converter:
- RGB(4:4:4) to/from YCbCr(4:4:4 or 4:2:2)
- Optional HDMI 1.4a supported video formats:
- HDMI 1.4a 3D video modes with up to 266MHz (TMDS clock)
- Optional HDMI 1.4a supported colorimetry:
- sYCC601
- Adobe RGB
- Adobe YCC601
- Optional HDMI 1.4a supported Infoframes:
- Audio InfoFrame packet extension to support LFE playback level information
- AVI infoFrame packet extension to support YCC Quantization range (Limited Range, Full Range)
- Range)

- AVI infoFrame packet extension to support Content type (Graphics, Photo, Cinema, Game)
- Supported Audio formats:
- Up to four I²S interface for eight-channel Linear-PCM audio
- S/PDIF interface for linear and non-linear PCM formats:
 - AC-3
 - MPEG-1/-2 Audio
 - DTS
 - MPEG- 2/-4 AAC
 - ATRAC
 - WMA
 - MAT
- Parallel audio interface for High-Bit Rate (HBR) Audio:
 - Dolby® True-HD
 - DTS®-HD Master Audio
 - Generic Parallel Audio interface
- AHB DMA Audio interface
- Up to 192 KHz IEC60958 audio sampling rate
- Pixel clock from 13.5MHz up to 266 MHz
- Option to remove pixel repetition clock (prepcclk) from HDMI TX interface for an easy integration with third-party HDMI TX PHYs
- Flexible synchronous enable per clock domain to set functional power down modes
- Register access:
- AMBA AHB
- I²C DDC, EDID block read mode
- Advanced PHY testability
- Integrated CEC hardware engine

33.2 External Signals

See HDMI PHY for external signal information.

33.3 Clocks

The table found here describes the clock sources for HDMI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 33-1. HDMI Clocks

| Clock name | Clock Root | Description |
|------------|--------------------|--|
| iahbclk | ahb_clk_root | Bus clock |
| icecclk | ckil_sync_clk_root | CEC low-frequency clock (32kHz) |
| ihclk | ahb_clk_root | Module clock |
| isfrclk | video_27m_clk_root | Internal SFR clock (video clock 27MHz) |

33.4 Functional Description

This section describes the functional architecture of the HDMI TX controller.

33.4.1 HDMI TX Functional Overview

The HDMI TX provides a variety of standard audio, video, and system interfaces.

It includes an high-bandwidth data content protection (HDCP) encryption engine for HDMI receiver authentication, revocation, and data encryption.

Figure below illustrates the top level diagram of the HDMI TX solution.

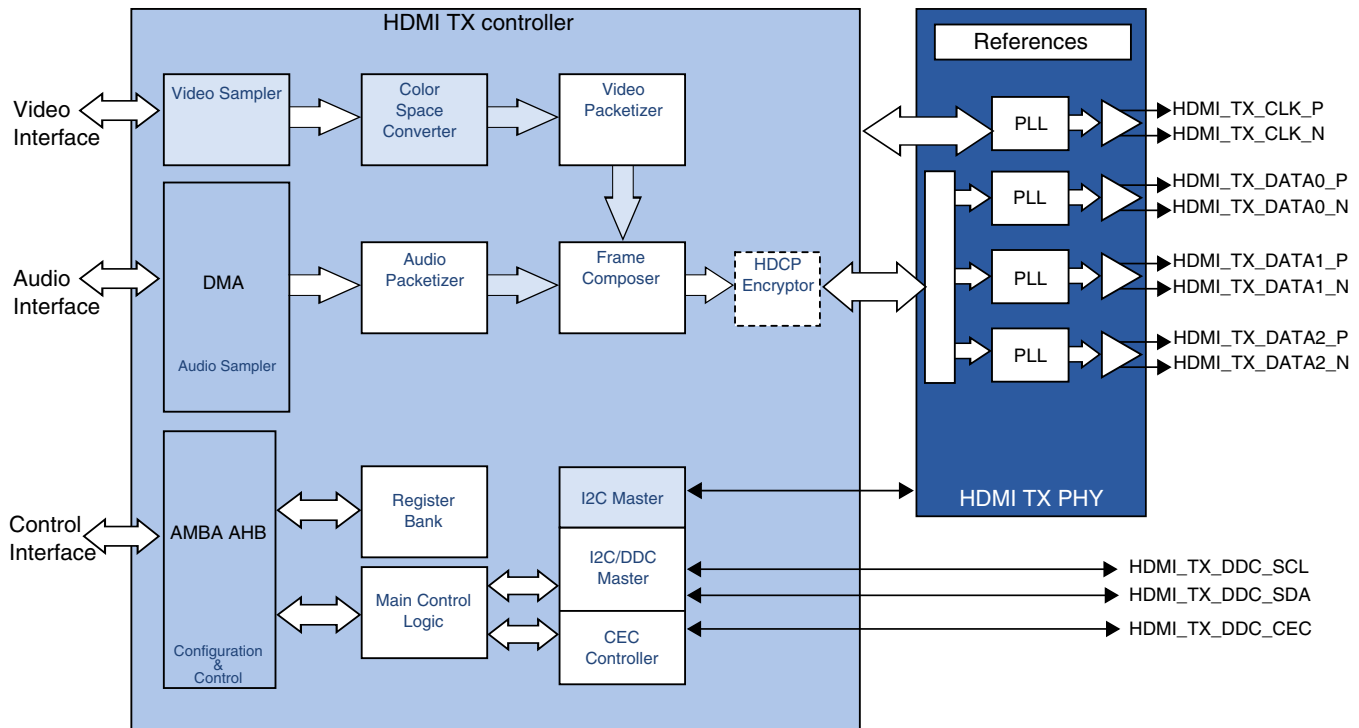

Figure 33-3. HDMI TX Top Level Block Diagram

The HDCP encryption engine is responsible for HDMI receiver authentication, revocation, and data encryption.

The input video stream can be either RGB 4:4:4, YcbCr 4:2:2, or YcbCr 4:4:4 in single data rate (SDR) bus formats as described in [Table 33-2](#). The video mode's timing format must follow the CEA-861-E specification. An embedded color space conversion allows the pixel color format to be converted on the HDMI source side to match the best with the HDMI sink capabilities. ²⁴

The input audio stream can be provided through audio AHB DMA interface;

Finally, HDMI_TX can output video in full HD with up to 48-bit color mode and inserts high fidelity audio up to eight-channels over low resolution video formats by performing automatic pixel repetition over the input video stream.

33.4.2 Video Pixel Sampler

The Video pixel sampler block is responsible for the video data synchronization, according to the video data input mapping defined by the Color Depth (Deep Color) and format configuration.

Functional Description

Optionally, for YCbCr 4:2:2 format, data mapping can be performed to conform to ITU. 601 and ITU.656 standards but without the support of embedded synchronizers.

The video pixel sampler registers base address is 0x0200.

33.4.2.1 HDMI Transmitter Controller Databook Functional Description

Table 33-2. Input Data Mapping

| Video Input Format | | ivdata[47:0] mapping | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|-------------|----------------------|-------|-------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|---------|-------|-------|-----|-----|-----|-----|-----|--|--|
| Color Space | Color Depth | 47-46 | 45-44 | 43-42 | 41-40 | 39-38 | 37-35 | 35-34 | 33-32 | 31-30 | 29-28 | 27-26 | 25-24 | 23-22 | 21-20 | 19-18 | 17-16 | 15-14 | 13-12 | 11-10 | 9-8 | 7-6 | 5-4 | 3-2 | 1-0 | | |
| RGB 4:4:4 | 8-bit | R[7:0] | | | | | | | | G[7:0] | | | | | | | | B[7:0] | | | | | | | | | |
| YCbCr 4:4:4 | 8-bit | Cb[7:0] | | | | | | | | Y[7:0] | | | | | | | | Cr[7:0] | | | | | | | | | |
| YCbCr 4:2:2 | 8-bit | Cb[7:0] | | | | | | | | Y[7:0] | | | | | | | | | | | | | | | | | |
| | | Cr[7:0] | | | | | | | | Y[7:0] | | | | | | | | | | | | | | | | | |

For each video timing format, there is a specific timing parameters defined in the CEA-861-E specification.

The following timing diagram is an example for the video mode format 1 (640x480p @ 59.94/60 Hz): Data Enable = idataen, HSYNC = ihsync, VSYNC = ivsync.

Figure 33-4. Timing Parameters for 640x480p @ 59.94/60 Hz

For a complete list of timing parameters and diagrams, refer to the CEA-861-E specification. The SDR video sample input format is illustrated in the figure below.

Figure 33-5. Video Sample Timing Interface for RGB and YCbCr SDR Format

33.4.3 Supported Video Mode

The table below shows examples of the supported video modes.

Table 33-3. Video Modes

| | | | | 2D | 3D Structure | | | | | | | |
|---|------|---------------------------------|-------------------|----------------------|---------------------------------|------------------------------|-----------------------------|---------------------------------------|---------------------------|--|---------------------------------------|----------------------------------|

33.4.4 Video Packetizer

This block is responsible for:

- Pixel repetition (if not already performed in the input video stream and needed by the user)
- 10-bit, 12-bit, and 16-bit packing when in deep color modes
- YCC 422 remapping according to the HDMI 1.4a specification
- Clock rate transformation from pixel or repetition clock to the final TMDS clock domain (by means of FIFOs)

The figure below depicts a functional diagram of the Video Packetizer block.

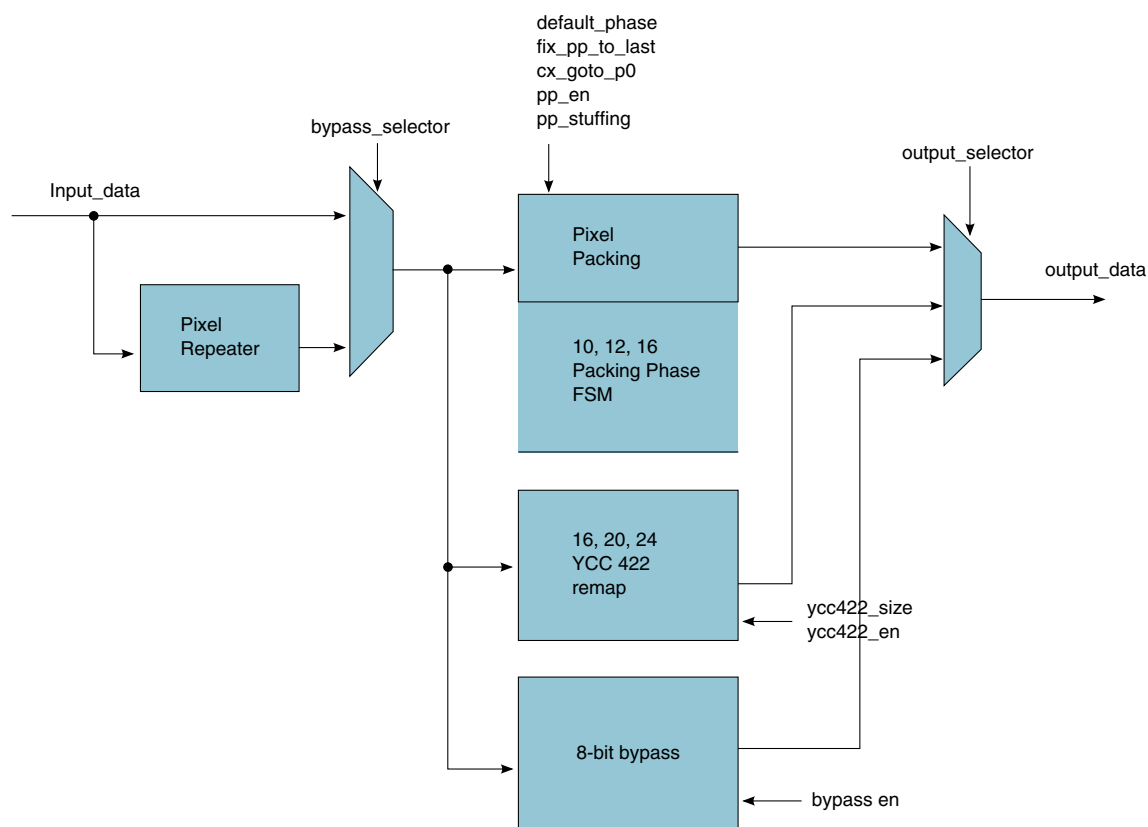

Figure 33-6. Video Packetizer Functional Diagram

33.4.5 Color Space Conversion

This block is responsible for carrying out the following video color space conversion functions:

- RGB to/from YCbCr
- 4:2:2 to/from 4:4:4 up (pixel repetition or linear interpolation)/down-converter
- Limited to/from full quantization range conversion

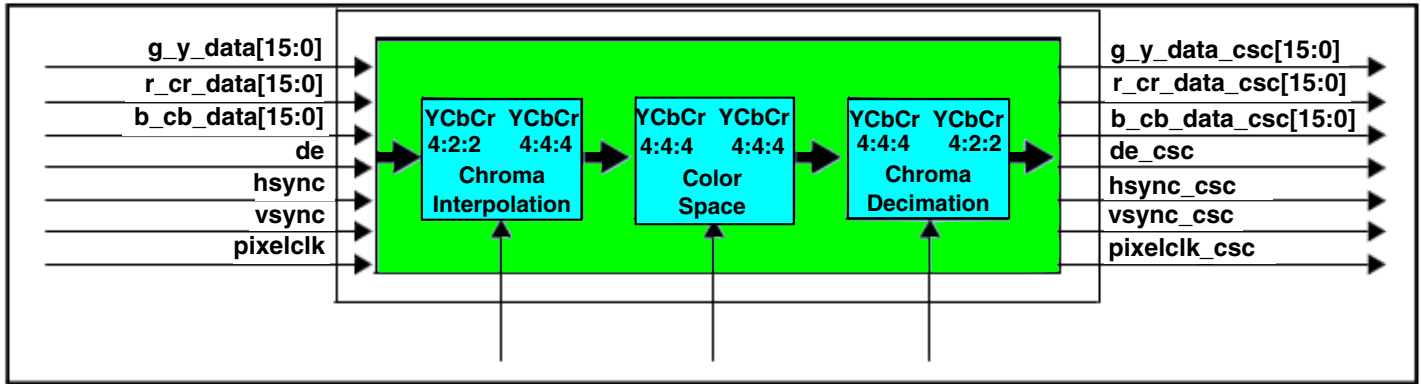

Figure 33-7. Color Space Converter Simplified Block Diagram

The Color Space Converter (CSC) supports all the timings reported in the CEA-861-D specification and the following pixel modes:

- RGB444 and YCbCr444: 24, 30, 36, and 48 bits
- YCbCr422: 16, 20, and 24 bits

The color space conversion matrix is ruled by the following equations listed below. The color space conversion registers base address is 0x4100.

$$\text{out}_1 = (X_1 \times \text{in}_1 / 4096 + X_2 \times \text{in}_2 / 4096 + X_3 \times \text{in}_3 / 4096 + X_4) \times 2^{\text{scale}}$$

$$\text{out}_2 = (Y_1 \times \text{in}_1 / 4096 + Y_2 \times \text{in}_2 / 4096 + Y_3 \times \text{in}_3 / 4096 + Y_4) \times 2^{\text{scale}}$$

$$\text{out}_3 = (Z_1 \times \text{in}_1 / 4096 + Z_2 \times \text{in}_2 / 4096 + Z_3 \times \text{in}_3 / 4096 + Z_4) \times 2^{\text{scale}}$$

33.4.6 Audio Interfaces

The supported audio input interfaces are:

- AHB Direct Memory Access (DMA)

No lipsync support is available inside the HDMI TX. If necessary, this feature can be performed at the system audio processor side. From the HDMI TX, no audio/video delay or skew is added.

The audio sampler registers base address is 0x3100.

33.4.6.1 CTS Calculation

Because there is no audio clock carried through the HDMI link, only the pixel clock is used.

The CTS/N has to be set by software with value taken in the following table. Table below shows the CTS and N value for the supported standard. All other TMDS clocks are not supported; the TMDS clocks divided or multiplied by 1,001 coefficients are not supported.

Table 33-4. N and CTS for 8-Bit Color Depth

| | TMDS Clock (MHz) | | | | | | | | | | | |
|-------------------------|--|-------|-------|-------|-------|-------|-------|-------|-------|--------|-------|--------|
| | 25.2 | | 27 | | 54 | | 74.25 | | 148.5 | | 297 | |
| F _s (kHz) | N | CTS | N | CTS | N | CTS | N | CTS | N | CTS | N | CTS |
| 32 | 4096 | 25200 | 4096 | 27000 | 4096 | 54000 | 4096 | 74250 | 4096 | 148500 | 3072 | 222750 |
| 44.1 | 6272 | 28000 | 6272 | 30000 | 6272 | 60000 | 6272 | 82500 | 6272 | 165000 | 4704 | 247500 |
| 48 | 6144 | 25200 | 6144 | 27000 | 6144 | 54000 | 6144 | 74250 | 6144 | 148500 | 5120 | 247500 |
| 88.2 | 12544 | 28000 | 12544 | 30000 | 12544 | 60000 | 12544 | 82500 | 12544 | 165000 | 9408 | 247500 |
| 96 | 12288 | 25200 | 12288 | 27000 | 12288 | 54000 | 12288 | 74250 | 12288 | 148500 | 10240 | 247500 |
| 176.4 | 25088 | 28000 | 25088 | 30000 | 25088 | 60000 | 25088 | 82500 | 25088 | 165000 | 18816 | 247500 |
| 192 | 24576 | 25200 | 24576 | 27000 | 24576 | 54000 | 24576 | 74250 | 24576 | 148500 | 20480 | 247500 |
| 768 | Used for HBR audio only. N and CTS configured for Fs=192kHz (1/4th ACR value per spec) | | | | | | | | | | | |

To support the deep color mode and/or 3D video modes, the TMDS clock is multiplied by 4, 2, 1.5, or 1.25, depending on the mode. In this case, the CTS value must also follow the same ratio.

33.4.6.2 Audio DMA Interface

This audio direct memory access (DMA) interface is intended for advanced systems running 32-bit CPU SoC solutions.

This module provides a direct audio DMA interface, which is useful in systems where a DSP handles audio processing. In these systems, sending the incoming audio samples directly to the memory provides a cleaner architecture to the SoC, without the overhead of converting several audio standards.

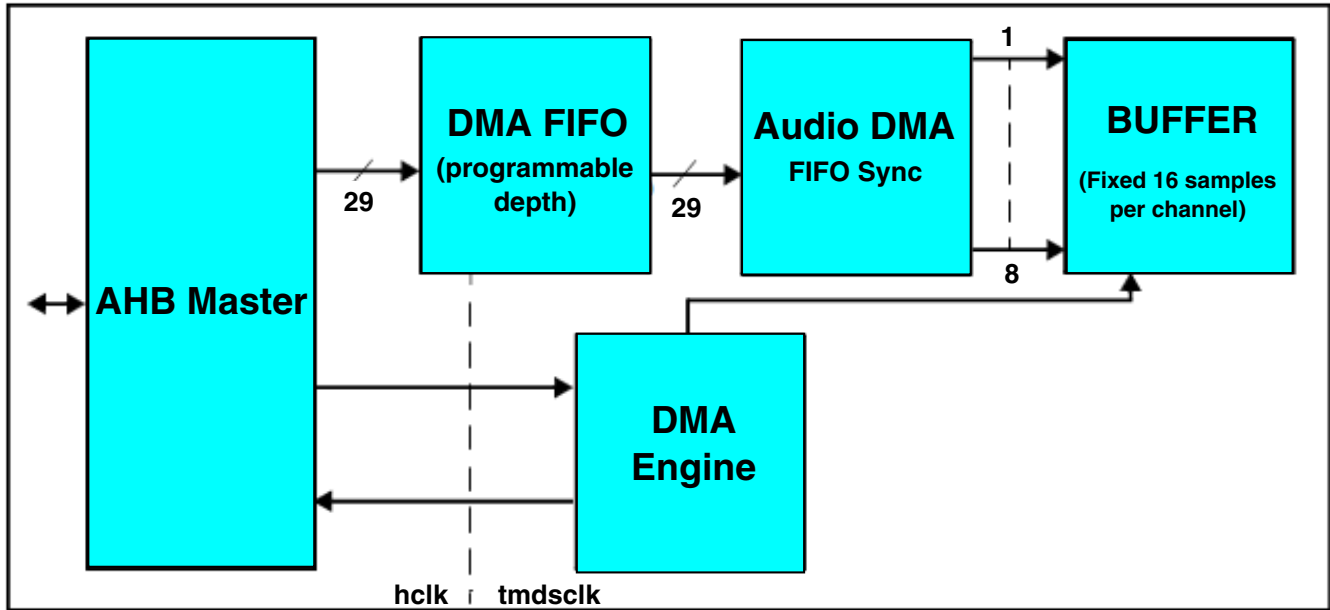

Figure 33-8. Audio DMA Block Diagram

The audio DMA block combines an AHB master interface with a FIFO to perform direct memory access to audio samples stored in a system memory.

The DMA engine is configurable through programmable software registers to perform autonomous burst reading on a configured memory range.

33.4.6.2.1 AHB Master

The AHB master is compliant with the AMBA AHB Specification, Revision 2.0 from ARM.

It has the following features:

- Multi-master capable operation
- 32-bit data transfer
- OKAY, ERROR, RETRY, and SPLIT slave responses
- Rescheduling of burst requirements
- IDLE, NONSEQ, and SEQ transfer types
- Incremental burst modes: unspecified lengths (upper limit is 1 kB boundary) and INCR, INCR4, INCR8, and INCR16 fixed-beat bursts
- Master burst lock mechanism

Functional Description

- Bus access granting
- The following features are not supported:
- Write transaction
- Protection control
- BUSY transfer type
- Wrapping burst

Data Organization in System Memory

The AHB master block fetches the samples from system memory. The Audio Samples are organized according to the channel allocation.

For example, channel 0, 1, 3, 5 are enabled (0 and 1 are always enabled). The Audio Samples must be organized in the system memory like the following:

Table 33-5. Audio Sample Arrangement in System Memory

| Position | Sample | Channel |
|----------|--------|---------|
| 0 | n-1 | 0 |
| 1 | n-1 | 1 |
| 2 | n-1 | 3 |
| 3 | n-1 | 5 |
| 4 | n-1 | 0 |
| 5 | n-1 | 1 |
| 6 | n-1 | 3 |
| 7 | n-1 | 5 |
| ... | ... | ... |

Table 33-6. Data Arrangement in System Memory for L-PCM (24 bits)

| Bit | Description |
|--------|------------------------|
| 28 | B - IEC B bit |
| 27 | P - Parity bit |
| 26 | C - Channel Status bit |
| 25 | U - User Data bit |
| 24 | V - Validity Bit |
| [23:0] | Audio Sample Data |

Table 33-7. Data Arrangement in System Memory for L-PCM (16 bits) and NL-PCM (16 bits)

| Bit | Description |
|-----|------------------------|
| 28 | B - IEC B bit |
| 27 | P - Parity bit |
| 26 | C - Channel Status bit |

Table continues on the next page...

Table 33-7. Data Arrangement in System Memory for L-PCM (16 bits) and NL-PCM (16 bits) (continued)

| | |
|--------|-------------------|
| 25 | U - User Data bit |
| 24 | V - Validity Bit |
| [23:8] | Audio Sample Data |
| [7:0] | 0x00 |

33.4.6.2.2 DMA Engine

The DMA engine is responsible for requesting burst transfers to the AHB master, taking into account the FIFO threshold and register settings.

33.4.6.2.2.1 Functional Behavior

The engine:

- Arbitrates read requests to start the burst in the initial address with the size sufficient to fill the FIFO (the size of the FIFO is a parameter in the audio DMA core).
- After this first request, the DMA engine performs subsequent burst requests (incrementing accordingly `ohaddr[31:0]` and determining correct `ohburst[2:0]`) towards `final_addr[31:0]` configured at the register bank and taking into account the `AUDIO_FIFO_DEPTH` parameter and `fifo_threshold[7:0]` configuration.
- In the burst mode (`INCR4`, `INCR8`, `INCR16`), the operation stops at the end of the burst.
- Stops operation upon `ERROR` slave response, signaling `ointerror` interrupt and `statererror` signal
- Continues burst transaction:
- Upon `RETRY/SPLIT` slave response, signaling `ointretrysplit` interrupt and `statretrysplit` signal
- Upon losing ownership (no `ihgrant`) as consequence of arbiter action, signaling `ointlostownership` interrupt and `statlostownership` signal
- Decides through register configuration which burst method (unspecified length incrementing or fixed beat incrementing) to use in the read transfers
- Issues `ointdone` interrupt when it reaches final address reading or is stopped upon user request
- Automatically starts new burst requests until the `final_addr[31:0]` is reached
- The DMA engine is either stopped by the user or an error/fail condition appears at the slave response.
- Takes into account that an incrementing burst can be of any length (if unspecified `INCR` type), but upper limit is set because the address must not cross a 1kB boundary

- A maximum theoretical length of a burst is 1024. The burst size must be declared on the `mburstlength_addr[10:0]`.
- Has INCR with an unspecified burst as the default operation burst mode

33.4.6.2.2.2 DMA Operation

Normal operation of the DMA engine is as follows:

1. The `enable_hlock`, `incr_type[1:0]`, `burst_mode`, `fifo_threshold[7:0]`, `initial_addr[31:0]`, and `final_addr[31:0]` are configured according to desired DMA operation.

NOTE

Configured values have to follow these rules:

The number of memory positions (between `initial_addr` and `final_addr`) has to be a multiple of the active audio channels.

The `final_addr[31:0]` signal is always bigger than the `initial_addr[31:0]`.

2. To start the audio DMA operation, a '1' is written to `data_buffer_ready`.
3. The DMA engine starts the operation. The first burst transfer is:

```
ohaddr[31:0] = initial_addr[31:0];
ohburst[2:0] = INCR;
mburstlength[10:0] = ((initial_addr[31:0] + AUDIO_FIFO_DEPTH) <=
final_addr[31:0]) ?
((AUDIO_FIFO_DEPTH < 1024) ? AUDIO_FIFO_DEPTH : 1024) : (final_addr[31:0] -
initial_addr[31:0]);
```

4. While DMA is reading samples from the AHB master and writing samples to the Audio FIFO, a datafetch request from the internal frame composer block might happen at the Audio FIFO interface, diminishing the number of samples in the FIFO.
5. When the number of samples in the Audio FIFO is lower than the configured `fifo_threshold[7:0]`, the DMA engine requests a new burst request to the AHB master interface with:

```
ohaddr[15:0] = last address in step 5);
ohburst[2:0] = INCR;
mburstlength[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0];
```

6. Steps 4) and 5) continue until the `final_addr[31:0]` is reached.

NOTE

In the last burst request, the DMA engine calculates the `mburstlength[10:0]` such that the last requested read position is the `final_addr[31:0]`.

7. After completion of the DMA operation, the DMA engine issues the `ointdone` interrupt signaling end of operation.

Variations of the DMA engine's behavior occur when fixed-beat, incremental bursts are used by `INCR4/INCR8/INCR16` burst selects. When this forcing mode is used, you must correctly configure the FIFO's threshold such that the last of the consecutive `INCRx` (with $x = 4, 8, \text{ or } 16$) bursts correctly fill the FIFO at last burst received. Note there is a re-alignment at the 1k boundary.

The following are exceptions to the described DMA behavior:

1. When a user requests `end stop_dma_transaction`, the DMA engine stops at the end of the current burst operation and signals its completion with an `ointdone` interrupt.
2. When the AHB slave sends an error response, the DMA engine stops the current operation and signals `ointerror` interrupt.

Rules for Configuration of Address Registers:

1. Configure the last 2 bits of `initial_addr` with 0.

For example, `32'h0000_0000`.

2. Configure the last 2 bits of `final_addr` with non-zero values.

For example

`32'hxxx_xxx3` or

`32'hxxx_xxx7` or

`32'hxxx_xxxB` or

`32'hxxx_xxxF`

Where $x = \text{any value}$

3. The number of samples is calculated by using the following formula:

$$\text{Number of samples} = (\text{final_addr} - \text{initial_addr} + 1) / 4$$

$$\text{Therefore, final_addr} = (\text{Number of samples} \times 4) + \text{initial_addr} - 1$$

If a defined length burst is used, align `initial_addr`, `final_addr` and `fifo_threshold` with the value. If

the burst is not aligned, DMA uses AHB INCR transfers when required.

Then the number of samples = 100 (a multiple of 5)

4. The threshold must be

Greater than the selected FIFO DEPTH;

Greater than the number of channels enabled in channel allocation.

Due to the limit of audio DMA design, some registers configuration are updated by SDMA (Smart Direct Memory Access). SDMA need to do these items below:

1. clear the audio DMA done request(actually it's an interrupt); set offset 0x00120109 -- bit2.
2. configure next audio DMA start address(offset 0x00123604~0x00123607) and next stop address(offset 0x00123608~0x0012360b); Start address and stop address are provided by S/W and it's variable.
3. Set offset 0x00123601 – bit0 “1” to start DMA;

33.4.6.2.2.3 Transfer Data, Package, and Word

One transfer data can be composed of several transfer packages, and one transfer package can be composed of one or several transfer bursts. One transfer burst can be composed of several transfer words.

The figure below shows the transfer data structure for a fixed-beat, incremental burst.

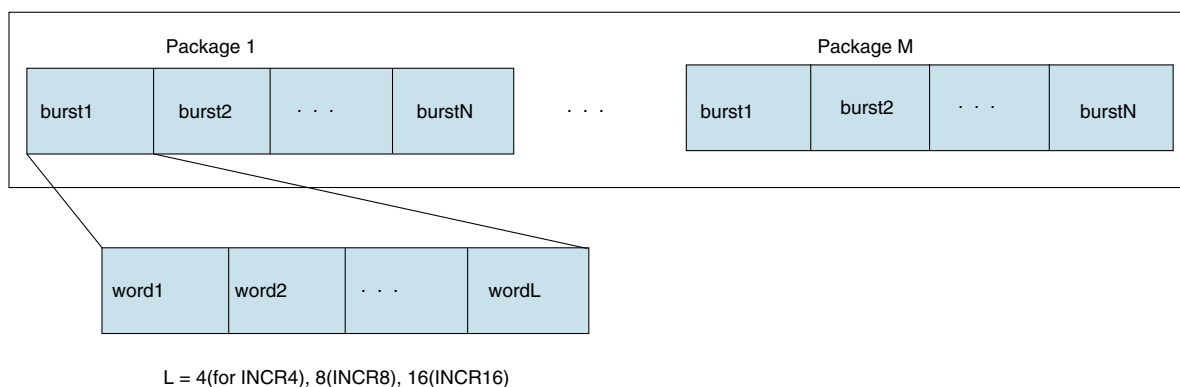

Figure 33-9. Transfer Data Constitution for Fixed-Beat, Incremental Burst

The figure below depicts the transfer data structure for an unspecified burst length.

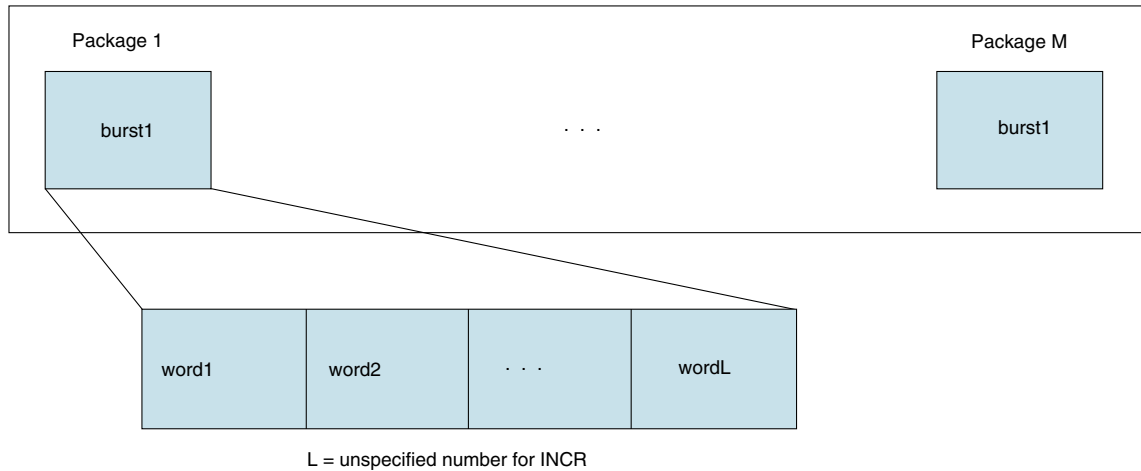

Figure 33-10. Transfer Data Constitution for Unspecified Burst Length

The figure below illustrates the DMA state machine.

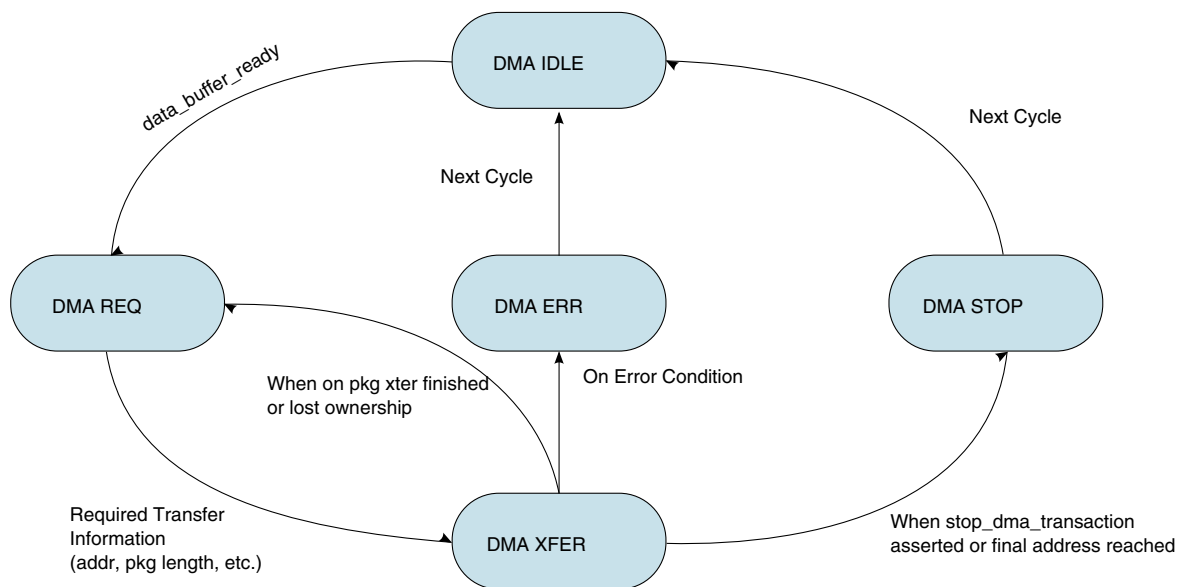

Figure 33-11. DMA FSM Diagram

1. When the operation request is written into the data_buffer_ready, the state switches from IDLE to DMAREQ.
2. When enough transfer information is ready, the state changes to DMAXFER.

3. When one package is completed-indicated by "OnePackOver"-or a lost ownership occurs, the state jumps back to DMAREQ, so the new transaction information can be calculated.
4. When the DMA is ready again, it jumps to DMAXFER.

The previous steps continue until you request an end operation or until the whole operation is completed.

33.4.6.2.3 Audio FIFO

This block contains a FIFO with a configurable depth.

The statthrfifoempty flag is a version of the FIFO empty, that is active whenever the amount of samples in the FIFO is smaller than four samples. The AHB_DMA_THRSLD and the statthrfifoempty indicators are different. The AHB_DMA_THRSLD defines the occupation of the FIFO, while statthrfifoempty helps the HDMI TX's Frame Composer in the audio packet composition (required when non-linear audio is being packed, in which case four pair of samples are needed to compose one packet).

33.4.6.2.4 FIFO Occupancy/FIFO Almost Empty Flags

The FIFO depth is configured by setting the AUDIO_FIFO_DEPTH parameter in coreConsultant. The FIFO occupancy is calculated from the pointer values.

Also, the most significant pointer bits are used to perform the following calculation:

```
occupancy = wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr > rdptr_previous  
occupancy = AUDIO_FIFO_DEPTH + wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr <  
rdptr_previous
```

If occupancy is less than 4, then statthrfifoempty is active.

An example of full/empty flags and FIFO occupancy is shown in the figure below.

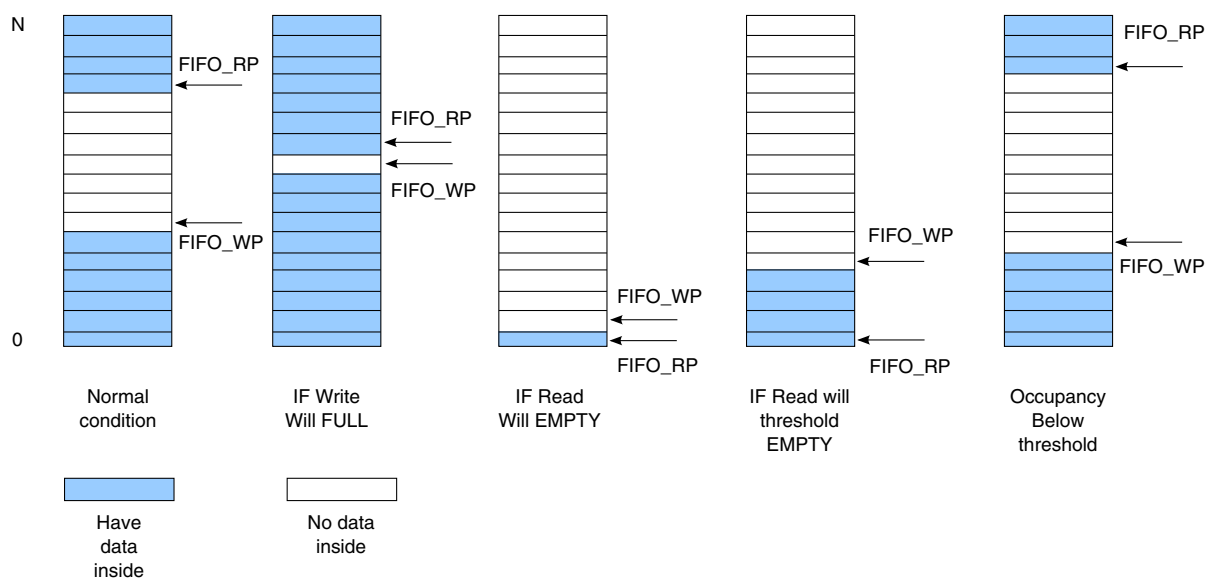

Figure 33-12. Audio FIFO Status Indication

33.4.7 Supported Audio Formats

The HDMI TX has several audio interfaces and each of them has different audio format support capabilities.

Table below represents the audio interface and format dependencies.

Table 33-8. Supported Audio Formats

| Audio Input Interface | Audio Format Supported |
|-----------------------|---|
| Audio DMA | Up to eight channels L-PCM/NL-PCM and HBR audio, allowing all audio formats listed to support one single audio DMA interface. |

33.4.8 Frame Composer

This block is responsible for assembling video, audio, and data packets in a consistent frame that are streamed to the HDCP cipher and then finally to the HDMI TX PHY.

The HDMI 1.3a standard precisely describes the packet insertion timing and distribution that must be followed to correctly compose an HDMI TMDS (transition minimized differential signaling) stream. In this context, there are data island packets that-when available (ready for insertion in output stream)-have higher priority over others. Two packet descriptor queues are responsible for prioritizing packet insertion.

The higher priority packets are described in Table below. These packets are inserted in the output stream as soon as data to compose them is available (see the HDMI 1.3a standard).

Table 33-9. High Priority Data Island Packets

| Packet | Description |
|--------------------------------|--|
| Audio Clock Regeneration (ACR) | Indicates to sink device the N/CTS values that should be used in the ACR process |
| Audio Sample (AUDS) | Transports L-PCM and IEC 61937 compressed audio |
| General Control (GCP) | Indicates Color Depth, Pixel Packing phase, and AV mute information to sink device |

The packets described in tables below can be considered as low priority packets-even though they have precise timing insertion-because their insertion timing is large (for example, one per frame or one per two frames without specific location for some of the packet types and on user request transmit for others).

Table 33-10. Low Priority Data Island Packets

| Packet | Description |
|---|--|
| Audio Content Protection (ACP) | Used to convey content-related information about the active audio stream transmitted |
| Audio InfoFrame (AUDI) | Indicates characteristics of the active audio stream by using IEC 60958 channel status bits, IEC 61937 burst info, and/or stream data (if present). |
| Null (NULL) | Ignored by sink devices. |
| International Standard Recording Code (ISRC1/ISRC2) | See HDMI 1.3a section 5.3.8. |
| Vendor Specific (VSD) InfoFrame | According to CEA-861-E standard. |
| AVI infoFrame (AVI) | Video information from source to sink. |
| Source Data Product Descriptor (SPD) infoFrame | Name and product type of the source device. MPEG (MPEG) Source InfoFrame packets (optional, implementation discouraged by CEA-861-E Section 6.7). Describes several aspects of the compressed video stream that were used to produce the uncompressed video. |

The Frame Composer distributes and assembles the data island packets according to the module register bank configuration. The block allows extended control periods to appear with a certain programmed spacing. The Frame Composer uses two packet buffers that allow a packet to be composed while another is being sent to the output HDMI stream.

Packet requests are inserted into the packet queues by a data island flexible scheduler. The HDMI 1.3a specification requires that packet distribution and insertion timing correctly compose an output HDMI TMDS stream. In this context, there are data island packets that are sent on data availability, while others are sent once per frame or once per two frames. and finally others that are sent on user request. Classification of the packets according to this insertion timing is described in the table below.

Table 33-11. Packet Classification

| Packet | Classification |
|---|--|
| Audio Clock Regeneration (ACR) | Sent on data availability. |
| Audio Sample (AUDS) | Sent on data availability (precede ACR if present). |
| Audio Content Protection (ACP) | On user request or automatic insertion. |
| Audio InfoFrame (AUDI) | Once per two frames. |
| Null (NULL) | On user request or automatic insertion to fill Data Island period. |
| General Control (GCP) | Once per frame. |
| International Standard Recording Code (ISRC1/ISRC2) | On user request. |
| Vendor Specific (VSD) InfoFrame | On user request or automatic insertion. |
| AVI infoFrame (AVI) | Once per frame. |
| Source Data Product Descriptor (SPD) infoFrame | On user request or automatic insertion. |

The Data Island Scheduler (DIS) handles packet distribution in the Frame Composer. The DIS is a round- robin (RDRB) state machine that is able to schedule packet insertion on an input video frame or line basis. The DIS is fully configurable and can schedule any packet type to be inserted at a given input video frame rate or input video line rate.

While determining packet distribution on an input video frame or line basis, the DIS schedules the packets to be inserted in the output HDMI stream by inserting the packet descriptor in the corresponding packet priority queue, according to packet priority classification.

After the packet descriptor has been inserted in the packet priority queues, the Data Island Packer (DIP) is responsible for assembling and sequencing the packets for output HDMI stream insertion.

Dedicated ECC generators and checksum byte-wide sum hardware generate the BCH ECC parity codes and infoFrames checksums for all the data islands packets.

The content of GCP, ISRC1/2, VSD, AVI, SPD, and MPEG packets are configured through the registers bank starting at address 0x1000.

33.4.9 HDCP Encryption Engine

HDCP is designed to protect the transmission of audio-visual content between an HDCP Transmitter and an HDCP Receiver.

The system also allows for HDCP Repeaters that support downstream HDCP-protected interface ports. The HDCP system allows up to seven levels of HDCP Repeaters and as many as 128 total HDCP devices, including HDCP Repeaters, to be attached to an HDCP-protected interface port.

NOTE

This feature must be configured and requires a separate license. Contact your Freescale representative for more information on HDCP.

The authentication protocol enables the HDCP Transmitter to verify that a given HDCP Receiver is licensed. With the legitimacy of the Receiver determined, encrypted HDCP content is transmitted between the two based on shared secrets established during authentication. In the event that legitimate devices are compromised to permit unauthorized use of the content, renewability allows an HDCP Transmitter to identify such compromised devices and prevent the transmission of the content.

The implemented HDCP functionality is compliant with HDCP revision 1.4. The HDCP transmitter implements the three layers of the HDCP cipher, including LFSR and other functions required to generate the encryption key bytes that are then XORed with the data.

33.4.10 EDID/HDCP I²C E-DDC Interface

The E-DDC channel is a dedicated I2C master interface that allows the read of sink E-EDID based on system needs.

Data read from sink E-EDID can be then transferred to the I2C Master register bank, starting at address 0x7E00.

This block reads the E-EDID (and all its segments according to user configuration) and, after completion, it warns the CPU of data availability. This block also arbitrates the I2C master interface to allow the HDMI TX's HDCP authentication protocol to be performed through this interface. Sink HDCP links (with addresses 0x74 and/or 0x76) should be present at these lines to enable HDCP-compliant behavior.

The interface is shared with the DDC channel of the HDMI controller through multiplexers and is I2C compliant.

33.4.10.1 I²C Master Interface Normal Mode

This operation implements a single read or write operation using the Special Function Register configuration.

The I²C data transfer protocol used is the 7-bit addressed, as defined in Section 9 of the I²C-bus Specification, version 2.1.

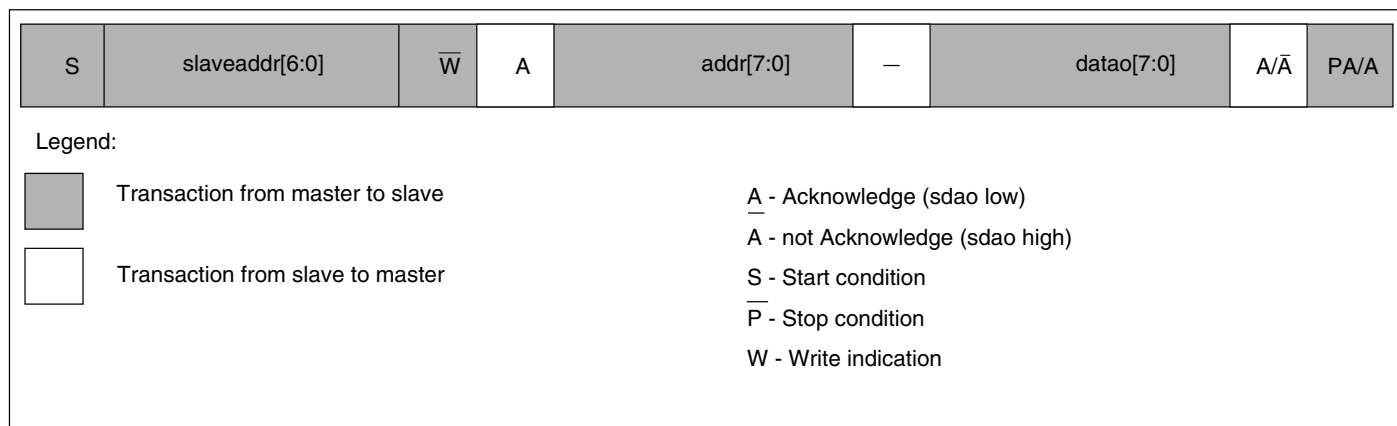

Figure 33-13. Data Write Transaction

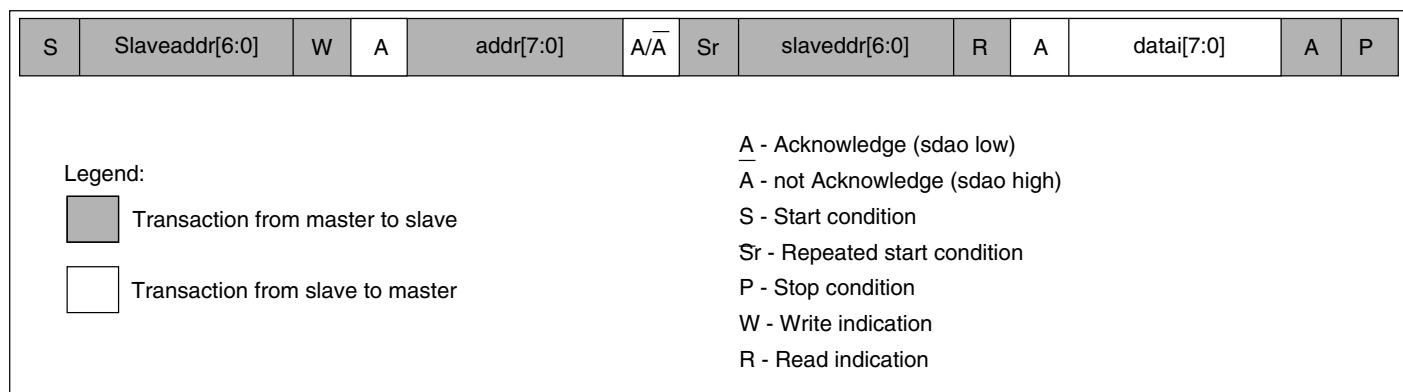

Figure 33-14. Data Read Transaction

33.4.10.2 I²C Master Interface Extended Read Mode

This I2C extended read mode operation implements a segment pointer-based read operation using the Special Register configuration.

Figure 33-15. Extended Data Read Operation

33.4.11 System Configuration Interfaces

The internal register set is distributed with the HDMI TX. The system interface (the interface that connects to the processor bus) bridges these registers using a simple standard interface.

The system interface is AMBA AHB.

The AHB bridges the bus to the internal SFR bus.

33.4.11.1 AMBA AHB Slave Interface

The AMBA AHB slave interface is compatible with the AMBA Specification, revision 2.0.

The AHB slave interface is used for register configuration implementing only a simple transaction mode and single master slave operation.

The HDMI TX does not support protection control, burst transfers, or split transactions.

33.4.12 CEC Hardware Engine

Consumer Electronics Control (CEC) is a protocol that provides high-level control functions between all of the various audiovisual products in a user's environment.

It is an optional feature in the HDMI 1.3a Specification. It uses only one bidirectional line for transmission and reception.

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgement bits.

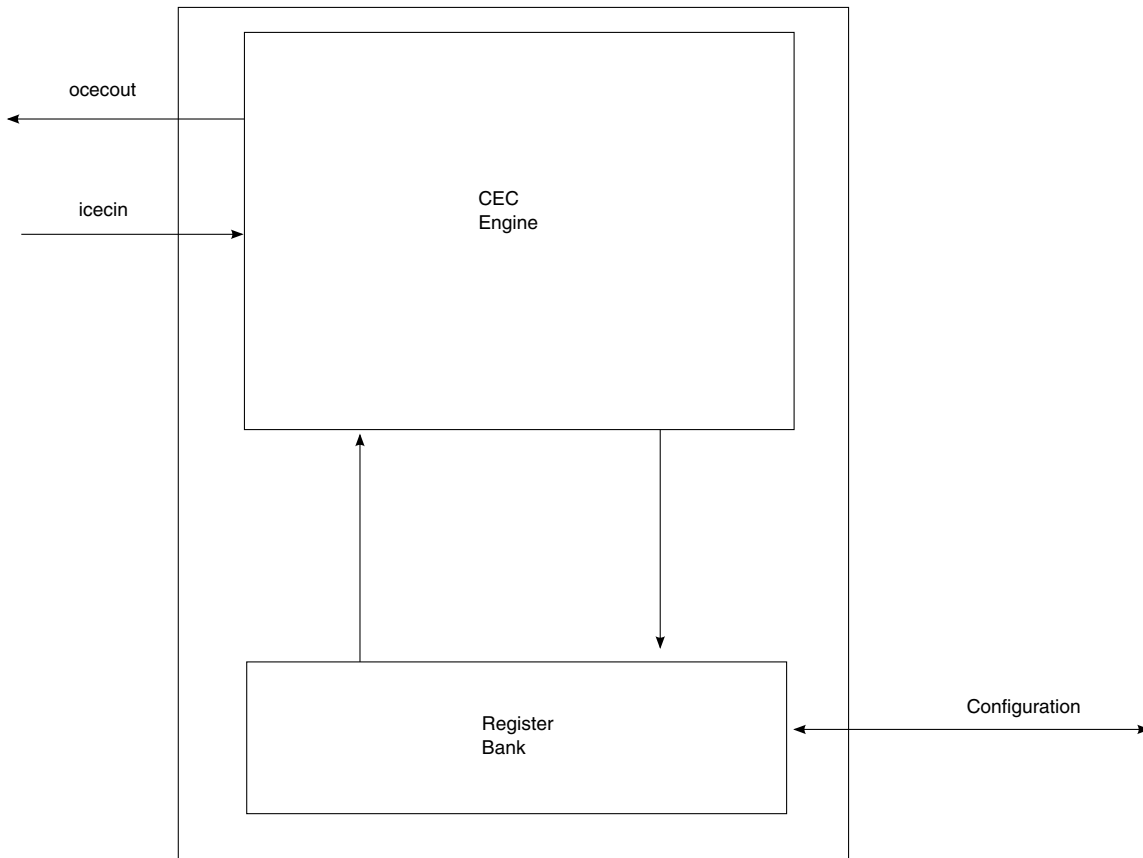

Figure 33-16. CEC Engine Simplified Block Diagram

There are two operation modes for a CEC controller.

- Initiator Mode
- In this mode, the CEC controller sends messages out and waits for a follower to feedback. The CEC controller works in this mode when it starts to send a frame. After the transmission is done, it automatically returns to the follower mode (no software control involved).

- Follower Mode
- In this mode, the CEC controller receives messages and feeds back the initiator with appropriate signals. The CEC controller always works in the follower mode whenever it is not transmitting any data.

For correct CEC controller interface operation, initial reset is required in order to set internal registers to a known state. After this reset, the interface is in an IDLE state, waiting for a read or write request coming from the register configuration.

A specific CEC API is provided that implements all necessary low-level register configuration to send and receive CEC messages. For more information, see the CEC API documentation.

The CEC engine registers base address is 0x7D00. For more information about these registers, see [HDMI Memory Map/Register Definition](#).

For more information about CEC, see *Consumer Electronics Control (CEC) Application Note*.

33.5 HDMI Memory Map/Register Definition

All registers are addressable on 32-bit boundaries; each unused bit or address location is reserved for future use and read back as 0.

HDMI memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|---|-----------------|--------|-------------|-----------------------------|
| 12_0000 | Design Identification Register (HDMI_DESIGN_ID) | 8 | R | 00h | 33.5.1/1567 |

| 12_7E12 | I2CM_FS_SCL_LCNT_0_ADDR (HDMI_I2CM_FS_SCL_LCNT_0_ADDR) | 8 | R/W | 24h | 33.5.337/1777 |
| 12_7F00 | BASE_POINTER_ADDR (HDMI_BASE_POINTER_ADDR) | 8 | R/W | 00h | 33.5.338/1777 |

33.5.1 Design Identification Register (HDMI_DESIGN_ID)

The following are the registers used to identify the HDMI TX controller.

- Name: Design Identification Register
- Address Offset: 0x0000
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 0h offset = 12_0000h

| | | | | | | | | |
|-------|-----------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | DESIGN_ID | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_DESIGN_ID field descriptions

| Field | Description |
|------------------|--|
| 7-0 DESIGN_ID | This is a 1 byte design ID code fixed by Freescale that identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 11h; REVISION_ID = 0Ah |

33.5.2 Revision Identification Register (HDMI_REVISION_ID)

- Name: Revision Identification Register
- Address Offset: 0x0001
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 1h offset = 12_0001h

HDMI_REVISION_ID field descriptions

| Field | Description |
|--------------------|--|
| 7–0 REVISION_ID | This is a one byte revision ID code fixed by Freescale that Identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 12h; REVISION_ID = 0Ah |

33.5.3 Product Identification Register 0 (HDMI_PRODUCT_ID0)

- Name: Product Identification Register 0
- Address Offset: 0x0002
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 2h offset = 12_0002h

HDMI_PRODUCT_ID0 field descriptions

| Field | Description |
|--------------------|--|
| 7–0 PRODUCT_ID0 | This one byte fixed code Identifies Freescale's product line ("A0h" for HDMI TX products). |

33.5.4 Product Identification Register 1 (HDMI_PRODUCT_ID1)

- Name: Product Identification Register 1
- Address Offset: 0x0003
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 3h offset = 12_0003h

| | | | | | | | | |
|-------|-------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | PRODUCT_ID1 | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_PRODUCT_ID1 field descriptions

| Field | Description |
|--------------------|--|
| 7-0 PRODUCT_ID1 | This one byte fixed code identifies Freescale's product line according to: 01h HDMI TX Controller C1h HDMI TX Controller with HDCP encryption engine |

33.5.5 Configuration Identification Register 0 (HDMI_CONFIG0_ID)

- Name: Configuration Identification Register 0
- Address Offset: 0x0004
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 4h offset = 12_0004h

| | | | | | | | | |
|-------|-------|--------|----------|--------|--------|-----|-----|------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | prepn | audhbr | audspdif | audi2s | hdmi14 | csc | cec | hdcp |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CONFIG0_ID field descriptions

| Field | Description |
|---------------|--|
| 7 prepen | Indicates if it is possible to use internal pixel repetition |
| 6 audhbr | Indicates if HBR interface is present |
| 5 audspdif | Indicates if SPDIF interface is present |
| 4 audi2s | Indicates if I2S interface is present |
| 3 hdmi14 | Indicates if HDMI 1.4 features are present |
| 2 csc | Indicates if Color Space Conversion block is present |
| 1 cec | Indicates if CEC is present |
| 0 hdcp | Indicates if HDCP is present |

33.5.6 Configuration Identification Register 1 (HDMI_CONFIG1_ID)

- Name: Configuration Identification Register 1
- Address Offset: 0x0005
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 5h offset = 12_0005h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|---|---|-----------|---------|---------|---------|---------|
| Read | Reserved | | | confsrdir | confi2c | confocp | confapb | confahb |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CONFIG1_ID field descriptions

| Field | Description |
|----------------|---|
| 7–5 - | This field is reserved. Reserved |
| 4 confsrdir | Indicates that configuration interface is SFR interface |
| 3 confi2c | Indicates that configuration interface is I2C interface |

Table continues on the next page...

HDMI_CONFIG1_ID field descriptions (continued)

| Field | Description |
|--------------|---|
| 2 confocp | Indicates that configuration interface is OCP interface |
| 1 confapb | Indicates that configuration interface is APB interface |
| 0 confahb | Indicates that configuration interface is AHB interface |

33.5.7 Configuration Identification Register 2 (HDMI_CONFIG2_ID)

- Name: Configuration Identification Register 2
- Address Offset: 0x0006
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 6h offset = 12_0006h

| | | | | | | | | |
|-------|---------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | phytype | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CONFIG2_ID field descriptions

| Field | Description |
|----------------|--|
| 7–0 phytype | Indicates the type of PHY interface selected: 00h Legacy PHY (HDMI TX PHY) F2h PHY_Gen2 (HDMI 3D TX PHY) E2h PHY_Gen2 (HDMI 3D TX PHY) + HEAC PHY |

33.5.8 Configuration Identification Register 3 (HDMI_CONFIG3_ID)

- Name: Configuration Identification Register 3
- Address Offset: 0x0007
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 7h offset = 12_0007h

HDMI_CONFIG3_ID field descriptions

| Field | Description |
|----------------|--|
| 7–1 - | This field is reserved. Reserved |
| 0 confgpaud | Indicates that configuration interface is Generic Parallel Audio (GPAUD) interface |

33.5.9 Frame Composer Interrupt Status Register 0 (HDMI_IH_FC_STAT0)

This section describes clear on write (1 to corresponding bit) status registers, which contain the following active-high, sticky bit interrupts.

HDMI TX introduces a new set of sticky bit mute control registers (IH_MUTE_FC_STAT0 to IH_MUTE_AHBDMAAUD_STAT0) that correspond to the interrupt registers. You can ignore a sticky bit interrupt by setting the corresponding mute control register bit to 1. This puts the global interrupt line on a higher priority than the sticky bit interrupt.

- Address Offset: 0x0100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 100h offset = 12_0100h

| | | | | | | | | |
|-------|------|-----|-----|-----|-----|------|-----|------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | AUDI | ACP | HBR | DST | OBA | AUDS | ACR | NULL |
| Write | w1c | w1c | w1c | w1c | w1c | w1c | w1c | w1c |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_IH_FC_STAT0 field descriptions

| Field | Description |
|-----------|--|
| 7 AUDI | Active after successful transmission of an Audio InfoFrame packet. |
| 6 ACP | Active after successful transmission of an Audio Content Protection packet. |
| 5 HBR | Active after successful transmission of an Audio HBR packet. |
| 4 DST | Reserved |
| 3 OBA | Reserved |
| 2 AUDS | Active after successful transmission of an Audio Sample packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer. |
| 1 ACR | Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet. |
| 0 NULL | Active after successful transmission of an Null packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer. |

33.5.10 Frame Composer Interrupt Status Register 1 (HDMI_IH_FC_STAT1)

- Address Offset: 0x0101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 101h offset = 12_0101h

| | | | | | | | | |
|-------|-----|-------|-------|-----|-----|------|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | GMD | ISCR1 | ISCR2 | VSD | SPD | MPEG | AVI | GCP |
| Write | w1c | w1c | w1c | w1c | w1c | w1c | w1c | w1c |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_IH_FC_STAT1 field descriptions

| Field | Description |
|------------|--|
| 7 GMD | Active after successful transmission of an Gamut metadata packet. |
| 6 ISCR1 | Active after successful transmission of an International Standard Recording Code 1 packet. |
| 5 ISCR2 | Active after successful transmission of an International Standard Recording Code 2 packet. |
| 4 VSD | Active after successful transmission of an Vendor Specific Data infoFrame packet. |
| 3 SPD | Active after successful transmission of an Source Product Descriptor infoFrame packet. |
| 2 MPEG | Reserved |
| 1 AVI | Active after successful transmission of an AVI infoFrame packet. |
| 0 GCP | Active after successful transmission of an General Control Packet. |

33.5.11 Frame Composer Interrupt Status Register 2 (HDMI_IH_FC_STAT2)

- Address Offset: 0x0102
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 102h offset = 12_0102h

| | | | | | | | | |
|-------|----------|---|---|---|---|---|--------------------------|---------------------------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | | | LowPriority_ overflow | HighPriority_ overflow |
| Write | | | | | | | w1c | w1c |
| Reset | | | | | | | 0 | 0 |

HDMI_IH_FC_STAT2 field descriptions

| Field | Description |
|-------------------------------|--|
| 7-2 - | This field is reserved. Reserved |
| 1 LowPriority_ overflow | Frame Composer low priority packet queue descriptor overflow indication. |

Table continues on the next page...

HDMI_IH_FC_STAT2 field descriptions (continued)

| Field | Description |
|--------------------------------|---|
| 0 HighPriority_ overflow | Frame Composer high priority packet queue descriptor overflow indication. |

33.5.12 Audio Sampler Interrupt Status Register (HDMI_IH_AS_STAT0)

- Address Offset: 0x0103
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 103h offset = 12_0103h

| | | | | | | | | |
|-------|----------|---|---|---|---|--------------------------------|------------------------|-----------------------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | | Aud_fifo_ underflow_ thr | Aud_fifo_ underflow | Aud_fifo_ overflow |
| Write | | | | | | w1c | w1c | w1c |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_IH_AS_STAT0 field descriptions

| Field | Description |
|---------------------------------|--|
| 7–3 - | This field is reserved. Reserved |
| 2 Aud_fifo_ underflow_thr | Audio Sampler audio FIFO empty threshold (four samples) indication. Only valid in HBR audio. |
| 1 Aud_fifo_ underflow | Audio Sampler audio FIFO empty indication. |
| 0 Aud_fifo_ overflow | Audio Sampler audio FIFO full indication. |

33.5.13 PHY Interface Interrupt Status Register (HDMI_IH_PHY_STAT0)

- Address Offset: 0x0104
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12_0000h base + 104h offset = 12_0104h

| | | | | |
|-------|-----------|-----------|-------------|-----------|
| Bit | 7 | 6 | 5 | 4 |
| Read | Reserved | | RX_SENSE3 | RX_SENSE2 |
| Write | | | w1c | w1c |
| Reset | 0 | 0 | 0 | 0 |
| Bit | 3 | 2 | 1 | 0 |
| Read | RX_SENSE1 | RX_SENSE0 | TX_PHY_LOCK | HDP |
| Write | w1c | w1c | w1c | w1c |
| Reset | 0 | 0 | 0 | 0 |

HDMI_IH_PHY_STAT0 field descriptions

| Field | Description |
|------------------|---|
| 7–6 - | This field is reserved. Reserved |
| 5 RX_SENSE3 | TX PHY RX_SENSE indication for driver 3. You may need to mask or change polarity of this interrupt after it has become active. |
| 4 RX_SENSE2 | TX PHY RX_SENSE indication for driver 2. You may need to mask or change polarity of this interrupt after it has become active. |
| 3 RX_SENSE1 | TX PHY RX_SENSE indication for driver 1. You may need to mask or change polarity of this interrupt after it has become active. |
| 2 RX_SENSE0 | TX PHY RX_SENSE indication for driver 0. You may need to mask or change polarity of this interrupt after it has become active. |
| 1 TX_PHY_LOCK | TX PHY PLL lock indication. Please refer to PHY datasheet for more information. You may need to mask or change polarity of this interrupt after it has become active. |
| 0 HDP | HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has become active. |

33.5.14 E-DDC I2C Master Interrupt Status Register (HDMI_IH_I2CM_STAT0)

- Address Offset: 0x0105
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12_0000h base + 105h offset = 12_0105h

| | | | | |
|-------|----------|---|---------------|-----------------|

HDMI_IH_VP_STAT0 field descriptions

| Field | Description |
|---------------------|---|
| 7 fifofullrepet | Video packetizer pixel repeater FIFO full interrupt |
| 6 fifoemptyrepet | Video packetizer pixel repeater FIFO empty interrupt |
| 5 fifofullpp | Video packetizer pixel packing FIFO full interrupt |
| 4 fifoemptypp | Video packetizer pixel packing FIFO empty interrupt |
| 3 fifofullremap | Video packetizer pixel YCC 422 re-mapper FIFO full interrupt |
| 2 fifoemptyremap | Video packetizer pixel YCC 422 re-mapper FIFO empty interrupt |
| 1 fifofullbyp | Video packetizer 8-bit bypass fifo full interrupt |
| 0 fifoemptybyp | Video packetizer 8-bit bypass fifo empty interrupt |

33.5.17 PHY GEN2 I2C Master Interrupt Status Register (HDMI_IH_I2CMPHY_STAT0)

This clear on write (1 to corresponding bit) register contains the following active high sticky bit interrupts. That I2C Master PHY is the I2C Master block used to access the PHY I2C Slave.

- Address Offset: 0x0108
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 108h offset = 12_0108h

| | | | | |
|-------|----------|---|--------------|---------------|

33.5.30 Video Input Mapping and Internal Data Enable Configuration Register (HDMI_TX_INVID0)

This registers contains the input video mapping code as defined in Table 2-1.

- Address Offset: 0x0200
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

Address: 12_0000h base + 200h offset = 12_0200h

| | | | | | | | | |
|-------|---------------------------|----------|---|---|---------------|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | internal_de_ generator | Reserved | | | video_mapping | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

HDMI_TX_INVID0 field descriptions

| Field | Description |
|--------------------------------|---|
| 7 internal_de_ generator | Internal data enable (DE) generator enable. If data enable is not available for the input video the user may set this bit to one to activate the internal data enable generator. NOTE: This feature only works for input video modes that have native repetition (such as, all CEA videos). No desired pixel repetition can be used with this feature because these configurations only affect the Frame Composer and not this block. |
| 6–5 - | This field is reserved. Reserved |
| 4–0 video_mapping | video_mapping |

33.5.31 Video Input Stuffing Enable Register (HDMI_TX_INSTUFFING)

This register enables the stuffing mechanism of the Video Sampler module in order to correctly perform Color Space Conversion of the ITU.601 standard YCC video. In this case, when "de" is low, the output video components gydata[15:0], rcrdata[15:0], and bcbdata[15:0] can be configured.

- Address Offset: 0x0201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 201h offset = 12_0201h

| | | | | | | | | |
|-------|----------|---|---|---|---|----------------------|----------------------|---------------------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | | BCBDATA_ STUFFING | RCRDATA_ STUFFING | GYDATA_ STUFFING |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_TX_INSTUFFING field descriptions

| Field | Description |
|---------------------------|---|
| 7-3 - | This field is reserved. Reserved |
| 2 BCBDATA_ STUFFING | BCBDATA stuffing bit 0 When the dataen signal is low, the value in the bcbdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the bcbdata[15:0] output is given by the values in register TX_BCBDA0 and TX_BCBDA1. |
| 1 RCRDATA_ STUFFING | RCRDATA stuffing bit 0 When the dataen signal is low, the value in the rcrdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the rcrdata[15:0] output is given by the values in TX_RCRDA0 and TX_RCRDATA1 registers. |
| 0 GYDATA_ STUFFING | GYDATA stuffing bit 0 when the dataen signal is low, the value in the gydata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the gydata[15:0] output is given by the values in TX_GYDA0 and TX_GYDATA1 registers. |

33.5.32 Video Input GY Data Channel Stuffing Register 0 (HDMI_TX_GYDATA0)

- Address Offset: 0x0202
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 202h offset = 12_0202h

| | | | | | | | | |
|-------|--------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | gydata | | | | | | | |

HDMI_VP_STATUS field descriptions

| Field | Description |
|----------|-------------------------------------|
| 7–4 - | This field is reserved. Reserved |

Table continues on the next page...

HDMI_VP_STATUS field descriptions (continued)

| Field | Description |
|----------------------|---|
| 3–0 packing_phase | Read only register that holds the "packing phase" output by the Video packetizer block. For more information about "packing" video data, refer to the HDMI1.4a specification. The register is updated at tmds clock rate. |

33.5.39 Video Packetizer Pixel Repetition and Color Depth Register (HDMI_VP_PR_CD)

This register configures the Color Depth of the input video and Pixel repetition to apply to video.

- Address Offset: 0x0801
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 801h offset = 12_0801h

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_VP_PR_CD field descriptions

| Field | Description |
|-------------------------------|--|
| 7–4 color_depth[3:0] | Color depth configuration: other Reserved. Not used. 0000 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0100 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0101 30 bits per pixel video (10 bit per component). 10-bit packing mode. 0110 36 bits per pixel video (12 bit per component). 12-bit packing mode. 0111 48 bits per pixel video (16 bit per component). 16-bit packing mode. |
| 3–0 desired_pr_factor[3:0] | Desired pixel repetition factor configuration. The configured value sets H13T PHY PLL to multiply pixel clock by the factor in order to obtain the desired repetition clock. For the CEA modes some are already defined with pixel repetition in the input video. So for CEA modes this shall be always 0. Shall only be used if the user wants to do pixel repetition using H13TCTRL core. other Reserved. Not used. 0000 No pixel repetition (pixel sent only once) 0001 Pixel sent 2 times (pixel repeated once) 0010 Pixel sent 3 times 0011 Pixel sent 4 times 0100 Pixel sent 5 times 0101 Pixel sent 6 times |

Table continues on the next page...

HDMI_VP_PR_CD field descriptions (continued)

| Field | Description |
|-------|---------------------|
| 0110 | Pixel sent 7 times |
| 0111 | Pixel sent 8 times |
| 1000 | Pixel sent 9 times |
| 1001 | Pixel sent 10 times |

33.5.40 Video Packetizer Stuffing and Default Packing Phase Register (HDMI_VP_STUFF)

This register controls the Pixel repetition, pixel packing and YCC422 stuffing.

- Address Offset: 0x0802
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 802h offset = 12_0802h

| | | | | |
|-------|----------------|-----------------|----------------|-----------------|
| Bit | 7 | 6 | 5 | 4 |
| Read | Reserved | | idefault_phase | ifix_pp_to_last |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |
| Bit | 3 | 2 | 1 | 0 |
| Read | icx_goto_p0_st | ycc422_stuffing | pp_stuffing | pr_stuffing |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |

HDMI_VP_STUFF field descriptions

| Field | Description |
|----------------------|--|
| 7–6 - | This field is reserved. Reserved |
| 5 idefault_phase | Controls the default phase packing machine used according to: "If the transmitted video format has timing such that the phase of the first pixel of every Video Data Period corresponds to pixel packing phase 0 (for example, 10P0, 12P0, 16P0), the Source may set the Default_Phase bit in the GCP. The Sink may use this bit to optimize it's filtering or handling of the PP field." (HDMI specification version 1.4a) This means that for 10 bit mode the Htotal must be dividable by 4 and for 12 bit mode the Htotal must be dividable by 2. |
| 4 ifix_pp_to_last | Reserved. Controls packing machine strategy. |
| 3 icx_goto_p0_st | Reserved. Controls packing machine strategy. |
| 2 ycc422_stuffing | YCC 422 remap stuffing control. For horizontal blanking: 0 YCC 422 remap block in direct mode (input blanking data goes directly to output). 1 YCC 422 remap block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00. |

Table continues on the next page...

HDMI_VP_STUFF field descriptions (continued)

| Field | Description |
|------------------|---|
| 1 pp_stuffing | Pixel packing stuffing control 0 Pixel packing block in direct mode (input blanking data goes directly to output). 1 Pixel packing block in stuffing mode. When "de_rep" goes to low the outputs are fixed to 0x00. |
| 0 pr_stuffing | Pixel repeater stuffing control 0 Pixel repeater block in direct mode (input blanking data goes directly to output). 1 Pixel repeater block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00. |

33.5.41 Video Packetizer YCC422 Remapping Register (HDMI_VP_REMAP)

This register controls YCC422 remap of the Video Packetizer. For more information about YCC422 remap refer to HDMI 1.4a specification.

- Address Offset: 0x0803
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 803h offset = 12_0803h

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_VP_REMAP field descriptions

|-------------------------|--|
| 7–2 - | This field is reserved. Reserved |
| 1–0 ycc422_size[1:0] | YCC 422 remap input video size: 00 YCC 422 16-bit input video (8 bits per component). 01 YCC 422 20-bit input video (10 bits per component). 10 YCC 422 24-bit input video (12 bits per component). 11 Reserved. Not used. |

33.5.42 Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI_VP_CONF)

This register controls the Video Packetizer output selection, bypass select, YCC422 enable, Pixel repeater, and pixel packing enabling.

- Address Offset: 0x0804
- Size: 8 bits
- Value after Reset: 0x46
- Access: Read/Write

Address: 12_0000h base + 804h offset = 12_0804h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|-----------|-------|-------|-----------|---------------|----------------------|---|
| Read | Reserved | bypass_en | pp_en | pr_en | ycc422_en | BYPASS_SELECT | output_selector[1:0] | |
| Write | | | | | | | | |
| Reset | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 0 |

HDMI_VP_CONF field descriptions

| Field | Description |
|-----------------------------|--|
| 7 - | This field is reserved. Reserved |
| 6 bypass_en | Bypass enable. Disabling forces bypass module to output always zeros. |
| 5 pp_en | Pixel packing enable. Disabling forces bypass module to output always zeros. |
| 4 pr_en | Pixel repeater enable. Disabling forces bypass module to output always zeros. |
| 3 ycc422_en | YCC 422 select enable. Disabling forces bypass module to output always zeros. |
| 2 BYPASS_SELECT | Bypass select bit 0 Data from pixel repeater block. 1 Data from input of video packetizer block. |
| 1-0 output_selector[1:0] | Video packetizer output selection. 00 Data from pixel packing block. 01 Data from YCC 422 remap block. 10 Data from 8-bit bypass block. 11 Data from 8-bit bypass block. |

33.5.43 VP_STAT (HDMI_VP_STAT)

This register contains the following active high FIFO status indications:

HDMI Memory Map/Register Definition

- Address Offset: 0x0805
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 805h offset = 12_0805h

| | | | | |
|-------|--------------|---------------|-----------|------------|
| Bit | 7 | 6 | 5 | 4 |
| Read | ostfullrepet | ostemptyrepet | ostfullpp | ostemptypp |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |

| | | | | |
|-------|--------------|---------------|------------|-------------|
| Bit | 3 | 2 | 1 | 0 |
| Read | ostfullremap | ostemptyremap | ostfullbyp | ostemptybyp |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |

HDMI_VP_STAT field descriptions

| Field | Description |
|--------------------|---|
| 7 ostfullrepet | Video packetizer pixel repeater FIFO full status. |
| 6 ostemptyrepet | Video packetizer pixel repeater FIFO empty status. |
| 5 ostfullpp | Video packetizer pixel packing FIFO full status. |
| 4 ostemptypp | Video packetizer pixel packing FIFO empty status. |
| 3 ostfullremap | Video packetizer pixel YCC 422 re-mapper FIFO full status. |
| 2 ostemptyremap | Video packetizer pixel YCC 422 re-mapper FIFO empty status. |
| 1 ostfullbyp | Video packetizer 8-bit bypass FIFO full status. |
| 0 ostemptybyp | Video packetizer 8-bit bypass FIFO empty status. |

33.5.44 VP_INT (HDMI_VP_INT)

This register contains the interrupt indication of the VP_STAT status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x0806
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 806h offset = 12_0806h

| | | | | |
|-------|---------------|----------------|------------|-------------|
| Bit | 7 | 6 | 5 | 4 |
| Read | ointfullrepet | ointemptyrepet | ointfullpp | ointemptypp |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |

| | | | | |
|-------|---------------|----------------|-------------|--------------|
| Bit | 3 | 2 | 1 | 0 |
| Read | ointfullremap | ointemptyremap | ointfullbyp | ointemptybyp |
| Write | | | | |
| Reset | 0 | 0 | 0 | 0 |

HDMI_VP_INT field descriptions

| Field | Description |
|---------------------|---|
| 7 ointfullrepet | Video packetizer pixel repeater FIFO full status |
| 6 ointemptyrepet | Video packetizer pixel repeater FIFO empty status |
| 5 ointfullpp | Video packetizer pixel packing FIFO full status |
| 4 ointemptypp | Video packetizer pixel packing FIFO empty status |
| 3 ointfullremap | Video packetizer pixel YCC 422 re-mapper FIFO full status. |
| 2 ointemptyremap | Video packetizer pixel YCC 422 re-mapper FIFO empty status. |
| 1 ointfullbyp | Video packetizer 8-bit bypass FIFO full status. |
| 0 ointemptybyp | Video packetizer 8-bit bypass FIFO empty status. |

33.5.45 Video Packetizer Interrupt Mask Register (HDMI_VP_MASK)

Mask register for generation of VP_INT interrupts.

HDMI Memory Map/Register Definition

- Address Offset: 0x0807
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 807h offset = 12_0807h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|---------|---------|---------|---------|---------|---------|---------|---------|
| Read | VPMASK7 | VPMASK6 | VPMASK5 | VPMASK4 | VPMASK3 | VPMASK2 | VPMASK1 | VPMASK0 |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_VP_MASK field descriptions

| Field | Description |
|--------------|---------------------------------------|
| 7 VPMASK7 | Mask bit for VP_INT[7] interrupt bit. |
| 6 VPMASK6 | Mask bit for VP_INT[6] interrupt bit. |
| 5 VPMASK5 | Mask bit for VP_INT[5] interrupt bit. |
| 4 VPMASK4 | Mask bit for VP_INT[4] interrupt bit. |
| 3 VPMASK3 | Mask bit for VP_INT[3] interrupt bit. |
| 2 VPMASK2 | Mask bit for VP_INT[2] interrupt bit. |
| 1 VPMASK1 | Mask bit for VP_INT[1] interrupt bit. |
| 0 VPMASK0 | Mask bit for VP_INT[0] interrupt bit. |

33.5.46 VP_POL (HDMI_VP_POL)

Polarity register for generation of VP_INT interrupts.

- Address Offset: 0x0808
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 808h offset = 12_0808h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|--------|--------|--------|--------|--------|--------|--------|--------|
| Read | VPPOL7 | VPPOL6 | VPPOL5 | VPPOL4 | VPPOL3 | VPPOL2 | VPPOL1 | VPPOL0 |
| Write | | | | | | | | |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

HDMI_VP_POL field descriptions

| Field | Description |
|-------------|---|
| 7 VPPOL7 | Polarity bit for VP_INT[7] interrupt bit. |
| 6 VPPOL6 | Polarity bit for VP_INT[6] interrupt bit. |
| 5 VPPOL5 | Polarity bit for VP_INT[5] interrupt bit. |
| 4 VPPOL4 | Polarity bit for VP_INT[4] interrupt bit. |
| 3 VPPOL3 | Polarity bit for VP_INT[3] interrupt bit. |
| 2 VPPOL2 | Polarity bit for VP_INT[2] interrupt bit. |
| 1 VPPOL1 | Polarity bit for VP_INT[1] interrupt bit. |
| 0 VPPOL0 | Polarity bit for VP_INT[0] interrupt bit. |

33.5.47 Frame Composer Input Video HActive Pixels Register 0 (HDMI_FC_INHACTIVO)

- Address Offset: 0x1001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1001h offset = 12_1001h

| | | | | | | | | |
|-------|-----------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | H_in_activ[7:0] | | | | | | | |

| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_FC_EXCTRLDUR field descriptions

| Field | Description |
|-----------------------------|---|
| 7–0 exctrlperiodduration | Configuration of the extended control period minimum duration (min. of 32 pixel clock cycles, see HDMI 1.4a specification). Integer number of pixel clocks cycles [0..255]. |

33.5.65 Frame Composer Extended Control Period Maximum Spacing Register (HDMI_FC_EXCTRLSPAC)

- Address Offset: 0x1013
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1013h offset = 12_1013h

| | | | | | | | | |
|-------|---------------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | exctrlperiodspacing | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_FC_EXCTRLSPAC field descriptions

| Field | Description |
|----------------------------|---|
| 7–0 exctrlperiodspacing | Configuration of the maximum spacing between consecutive extended control periods (max of 50msec, see HDMI 1.4a specification): generated spacing = (1/freq tmds clock)*256*256*extctrlperiodspacing |

33.5.66 Frame Composer Channel 0 Non-Preamble Data Register (HDMI_FC_CH0PREAM)

- Address Offset: 0x1014
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1014h offset = 12_1014h

| | | | | | | | | |
|-------|---------------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | ch0_preamble_filter | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_FC_CH0PREAM field descriptions

| Field | Description |
|----------------------------|---|
| 7–0 ch0_preamble_filter | When in control mode, configures 8-bits that are going to fill the channel 0 data lines not used to transmit the preamble (for more clarifications refer to HDMI 1.4a specification). |

33.5.67 Frame Composer Channel 1 Non-Preamble Data Register (HDMI_FC_CH1PREAM)

- Address Offset: 0x1015
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1015h offset = 12_1015h

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_FC_GCP field descriptions

| Field | Description |
|--------------------|---|
| 7-3 - | This field is reserved. Reserved |
| 2 default_phase | Value of "default_phase" in the GCP packet. This data should be equal to the default phase used at Video packetizer packing machine. Value after Reset: 0b |
| 1 set_avmute | Value of "set_avmute" in the GCP packet. Value after Reset: 0b |
| 0 clear_avmute | Value of "clear_avmute" in the GCP packet. Value after Reset: 0b |

33.5.71 Frame Composer AVI Packet Configuration Register 0 (HDMI_FC_AVICONF0)

Configures the following contents of the AVI infoFrame:

- RGB/YCC indication
- Bar information
- Scan information
- Active format present
- Progressive/Interlaced indicator
- Active aspect ratio
- Picture aspect ratio
- Colorimetry
- IT content
- Extended colorimetry
- Quantization range
- Non-uniform picture scaling

For more information, refer to HDMI 1.4a and CEA - 861D specifications.

- Address Offset: 0x1019
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

HDMI Memory Map/Register Definition

|-------------------|---|
| 7-0 FC_AVISRB1 | Pixel number of start of right Bar (upper 8 bits) |

33.5.83 Frame Composer AUD Packet Configuration Register 0 (HDMI_FC_AUDICONF0)

These registers configure the following contents of the AUDIO infoFrame:

- Coding type
- Channel count
- Sampling frequency
- Sampling size
- Channel allocation
- Audio level shift value
- Down mix enable

For more information, refer to CEA-861D specification.

- Address Offset: 0x1025 to 0x1028
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For the FC_AUDICONF0 register, bits [6:5] correspond to LFEPBL1, LFEPBL0 LFE playback level as compared to the other channels (from HDMI 1.4a specification).

Address: 12_0000h base + 1025h offset = 12_1025h

HDMI_FC_AUDSCONF field descriptions

| Field | Description |
|--------------------------------|---|
| 7–4 aud_packet_sampfit[3:0] | Set the audio packet sample flat value to be sent on the packet. |
| 3–1 - | This field is reserved. Reserved |
| 0 aud_packet_layout | Set the audio packet layout to be sent in the packet: 1 layout 1 0 layout 0 |

33.5.119 Frame Composer Audio Packet Sample Present Status Register (HDMI_FC_AUDSSTAT)

Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. For more information, refer to HDMI 1.4a specification.

- Address Offset: 0x1064

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 1064h offset = 12_1064h

| | | | | | | | | |

HDMI_FC_CTRLQHIGHIGH field descriptions

| Field | Description |
|----------------------------|--|
| 7–5 - | This field is reserved. Reserved |
| 4–0 onhighattended[4:0] | Configures the number of high priority packets or audio sample packets consecutively attended before checking low priority queue status. Integer number [0..31] |

33.5.121 Frame Composer Number of Low Priority Packets Attended Configuration Register (HDMI_FC_CTRLQLOW)

- Address Offset: 0x1074
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12_0000h base + 1074h offset = 12_1074h

HDMI_FC_CTRLQLOW field descriptions

| Field | Description |
|---------------------------|---|
| 7–5 - | This field is reserved. Reserved |
| 4–0 onlowattended[4:0] | Configures the number of low priority packets or null packets consecutively attended before checking high priority queue status or audio sample availability. Integer number [0..31] |

33.5.122 Frame Composer ACP Packet Type Configuration Register 0 (HDMI_FC_ACP0)

Configures the following contents of the ACP packet. For more information, refer to the HDMI 1.4 specification.

- Address Offset: 0x1075
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1075h offset = 12_1075h

HDMI_FC_ACP0 field descriptions

| Field | Description |
|---------------------|---------------------------------|
| 7–0 acptype[7:0] | Configures the ACP packet type. |

33.5.123 Frame Composer ACP Packet Type Configuration Register 1 (HDMI_FC_ACP1)

Configures the following contents of the Audio Content Packet (ACP) body:

- Address Offset: 0x1091 to 0x1082
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1091h offset = 12_1091h

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_FC_ACP1 field descriptions

| Field | Description |
|--------------------------------|----------------------|
| 7–0 Audio_ contentpacket | Audio content packet |

33.5.124 FC_ISCR1_Frame Composer Packet Status, Valid, and Continue Configuration Register (HDMI_FC_ISCR1_0)

Configures the following contents of the ISRC1 packet:

- Address Offset: 0x1092
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

| 1 isrc_valid | Valid of ISRC1. |
| 0 isrc_cont | Indication of ISRC2. |

33.5.125 Frame Composer ISCR1 Packet Body Register 1 (HDMI_FC_ISCR1_1)

Configures the following contents of the ISRC1 packet:

- ISRC1 packet body
- Address Offset: 0x10A2 to 0x1093
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12_0000h base + 1093h offset = 12_1093h

| 7–0 isrc2 | Configures the contents of the ISRC1 packet: |

33.5.127 Frame Composer Data Island Auto Packet Scheduling Register 0 (HDMI_FC_DATAUTO0)

Configures the Frame Composer RDRB(1)/Manual(0) data island packet insertion for SPD, VSD, ISRC2, ISRC1 and ACP packets. On RDRB mode the described packet scheduling is controlled by registers FC_DATAUTO1 and FC_DATAUTO2, while in Manual mode register FC_DATMAN requests to FC the insertion of the requested packet.

- Address Offset: 0x10B3
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B3h offset = 12_10B3h

HDMI_FC_STAT0 field descriptions

| Field | Description |
|-----------|--|
| 7 AUDI | Status bit Active after successful transmission of an Audio InfoFrame packet. |
| 6 ACP | Status bit. Active after successful transmission of an Audio Content Protection Packet. |
| 5 HBR | Status bit. Active after successful transmission of an Audio HBR packet |
| 4–3 - | This field is reserved. Reserved |
| 2 AUDS | Status bit Active after successful transmission of an Audio Sample packet. |
| 1 ACR | Status bit Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet. |
| 0 NULL | Status bit Active after successful transmission of an Null packet. |

33.5.141 FC_INT0 (HDMI_FC_INT0)

This register contains the interrupt indication of the FC_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x10D1
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D1h offset = 12_10D1h

| 2 - | This field is reserved. Reserved |
| 1 AVI | Polarity bit for FC_INT1.AVI interrupt bit |
| 0 GCP | Polarity bit for FC_INT1.GCP interrupt bit |

33.5.148 FC_STAT2 (HDMI_FC_STAT2)

This register contains the following active high packet sent status indications:

- Address Offset: 0x10D8
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D8h offset = 12_10D8h

HDMI_FC_STAT2 field descriptions

| Field | Description |
|--------------------------------|---|
| 7-2 - | This field is reserved. Reserved |
| 1 LowPriority_ overflow | Status bit Frame Composer low priority packet queue descriptor overflow indication. |
| 0 HighPriority_ overflow | Status bit Frame Composer high priority packet queue descriptor overflow indication. |

33.5.149 FC_INT2 (HDMI_FC_INT2)

This register contains the interrupt indication of the FC_STAT2 status interrupts. Interrupt generation is accomplished in the following way:

`interrupt = (mask == 1'b0) && (polarity == status);`

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x10D9
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

HDMI Memory Map/Register Definition

Address: 12_0000h base + 10D9h offset = 12_10D9h

33.5.152 Frame Composer Pixel Repetition Configuration Register (HDMI_FC_PRCONF)

Defines the Pixel Repetition ratio factor of the input and output video signal.

- Address Offset: 0x10E0
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

Address: 12_0000h base + 10E0h offset = 12_10E0h

| | | | | | | | | |
|-------|-------------------------|---|---|---|-----------------------|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | incoming_pr_factor[3:0] | | | | output_pr_factor[3:0] | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

HDMI_FC_PRCONF field descriptions

| Field | Description |
|--------------------------------|---|
| 7–4 incoming_pr_factor[3:0] | <p>Configures the input video pixel repetition. A plus 1 factor should be added in this register configuration. For CEA modes this value should be extracted from the CEA spec for the video mode being inputted.</p> <p>NOTE: When working in YCC422 video the actual repetition of the stream will be Incoming_pr_factor * (desired_pr_factor + 1). This calculation is done internally in the H13TCTRL and no HW overflow protection is available. Care must be taken to avoid this result passes the maximum number of 10 pixels repeated since no HDMI support is available for this in the spec and the H13TPHY does not support this higher repetition values.</p> <p>other: Reserved. Not used.</p> <p>0000 No action. Shall not be used. 0001 No pixel repetition (pixel sent only once). 0010 Pixel sent twice (pixel repeated once). 0011 Pixel sent 3 times. 0100 Pixel sent 4 times. 0101 Pixel sent 5 times. 0110 Pixel sent 6 times. 0111 Pixel sent 7 times. 1000 Pixel sent 8 times. 1001 Pixel sent 9 times. 1010 Pixel sent 10 times.</p> |
| 3–0 output_pr_factor[3:0] | <p>Configures the video pixel repetition ratio to be sent on the AVI infoFrame. This value must be valid according to HDMI spec. The output_pr_factor = incoming_pr_factor(without the + 1 factor) * desired_pr_factor.</p> <p>other: Reserved. Not used.</p> <p>0000 No action. Shall not be used. 0001 Pixel sent twice (pixel repeated once). 0010 Pixel sent 3 times. 0011 Pixel sent 4 times. 0100 Pixel sent 5 times. 0101 Pixel sent 6 times. 0110 Pixel sent 7 times. 0111 Pixel sent 8 times. 1000 Pixel sent 9 times. 1001 Pixel sent 10 times.</p> |

33.5.153 Frame Composer GMD Packet Status Register (HDMI_FC_GMD_STAT)

Gamut metadata packet status bit information for no_current_gmd, next_gmd_field, gmd_packet_sequence and current_gamut_seq_num. For more information, refer to the HDMI 1.4a specification.

- Address Offset: 0x1100
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 1100h offset = 12_1100h

| | | | | |

| Field | Description |
|---------------------------------------|--|
| 7 igmdno_crnt_gbd | Gamut scheduling: No current gamut data |
| 6 igmdnext_field | Gamut scheduling: Gamut Next field |
| 5–4 igmdpaket_seq[1:0] | Gamut scheduling: Gamut packet sequence |
| 3–0 igmdcurrent_gamut_seq_num[3:0] | Gamut scheduling: Current Gamut packet sequence number |

33.5.154 Frame Composer GMD Packet Enable Register (HDMI_FC_GMD_EN)

This register enables Gamut metadata (GMD) packet transmission. Packets are inserted in the incoming frame, starting in the line where active Vsync indication starts. After enable of GMD packets the outgoing packet is sent with no_current_gmd active indication until update GMD request is performed in the controller.

- Address Offset: 0x1101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

HDMI Memory Map/Register Definition

Address: 12_0000h base + 1101h offset = 12_1101h

| 7-1 - | This field is reserved. Reserved |
| 0 gmdenabletx | Gamut Metadata packet transmission enable (1b). |

33.5.155 Frame Composer GMD Packet Update Register (HDMI_FC_GMD_UP)

This register performs an GMD packet content update according to the configured packet body (FC_GMD_PB0 to FC_GMD_PB27) and packet header (FC_GMD_HB). This active high auto clear register reflects the body and header configurations on the GMD packets sent arbitrating the current_gamut_seq_num, gmd_packet_sequence and next_gmd_field bits on packet to correctly indicate to source the Gamut change to be performed. After enable GMD packets the first update request is also responsible for deactivating the no_current_gmd indication bit. Attention packet update request must only be done after correct configuration of GMD packet body and header registers. Correct affected_gamut_seq_num and gmd_profile configuration is user responsibility and must convey with HDMI 1.4a standard gamut rules.

- Address Offset: 0x1102
- Size: 8 bits
- Value after Reset: 0x00

| 0 gmdupdatepacket | Gamut Metadata packet update. |

33.5.156 Frame Composer GMD Packet Schedule Configuration Register (HDMI_FC_GMD_CONF)

This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets. Note that for profile P0 (refer to HDMI 1.4a spec) this register should only indicate one GMD packet to be inserted per video field.

- Address Offset: 0x1103
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

Address: 12_0000h base + 1103h offset = 12_1103h

HDMI_PHY_STAT0 field descriptions

| Field | Description |
|------------------|--|
| 7 RX_SENSE3 | Status bit. TX PHY RX_SENSE indication for TMDS CLK driver. User may need to mask or change polarity of this interrupt after it has become active. |
| 6 RX_SENSE2 | Status bit. TX PHY RX_SENSE indication for TMDS channel 2 driver. User may need to mask or change polarity of this interrupt after it has become active. |
| 5 RX_SENSE1 | Status bit. TX PHY RX_SENSE indication for TMDS channel 1 driver. User may need to mask or change polarity of this interrupt after it has become active. |
| 4 RX_SENSE0 | Status bit. TX PHY RX_SENSE indication for TMDS channel 0 driver. User may need to mask or change polarity of this interrupt after it has become active. |
| 3–2 - | This field is reserved. Reserved |
| 1 HPD | Status bit. HDMI Hot Plug Detect indication. User may need to mask or change polarity of this interrupt after it has become active. |
| 0 TX_PHY_LOCK | Status bit. TX PHY PLL lock indication. Please refer to PHY datasheet for more information. User may need to mask or change polarity of this interrupt after it has become active. |

33.5.219 PHY RXSENSE, PLL lock, and HPD Interrupt Register (HDMI_PHY_INT0)

This register contains the interrupt indication of the PHY_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

$\text{interrupt} = (\text{mask} == 1'b0) \&\& (\text{polarity} == \text{status});$

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x3005
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3005h offset = 12_3005h

| Field | Description |
|------------------|---|
| 7 RX_SENSE3 | Mask bit for PHY_INT0.RX_SENSE3 interrupt bit |
| 6 RX_SENSE2 | Mask bit for PHY_INT0.RX_SENSE2 interrupt bit |
| 5 RX_SENSE1 | Mask bit for PHY_INT0.RX_SENSE1 interrupt bit |
| 4 RX_SENSE0 | Mask bit for PHY_INT0.RX_SENSE0 interrupt bit |
| 3–2 - | This field is reserved. Reserved |
| 1 HPD | Mask bit for PHY_INT0.HPD interrupt bit |
| 0 TX_PHY_LOCK | Mask bit for PHY_INT0.TX_PHY_LOCK interrupt bit |

33.5.221 PHY RXSENSE, PLL lock and HPD Polarity Register (HDMI_PHY_POLO)

Polarity register for generation of PHY_INT0 interrupts.

- Address Offset: 0x3007
- Size: 8 bits
- Value after Reset: 0xF3
- Access: Read/Write

Address: 12_0000h base + 3007h offset = 12_3007h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|-----------|-----------|-----------|-----------|----------|---|-----|-------------|
| Read | RX_SENSE3 | RX_SENSE2 | RX_SENSE1 | RX_SENSE0 | Reserved | | HPD | TX_PHY_LOCK |
| Write | | | | | | | | |
| Reset | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |

HDMI_PHY_POLO field descriptions

| Field | Description |
|------------------|---|
| 7 RX_SENSE3 | Polarity bit for PHY_INT0.RX_SENSE3 interrupt bit |
| 6 RX_SENSE2 | Polarity bit for PHY_INT0.RX_SENSE2 interrupt bit |
| 5 RX_SENSE1 | Polarity bit for PHY_INT0.RX_SENSE1 interrupt bit |
| 4 RX_SENSE0 | Polarity bit for PHY_INT0.RX_SENSE0 interrupt bit |
| 3-2 - | This field is reserved. Reserved |
| 1 HPD | Polarity bit for PHY_INT0.HPD interrupt bit |
| 0 TX_PHY_LOCK | Polarity bit for PHY_INT0.TX_PHY_LOCK interrupt bit |

33.5.222 PHY I2C Slave Address Configuration Register (HDMI_PHY_I2CM_SLAVE_ADDR)

This register writes the slave address of the I2C Master PHY.

- Address Offset: 0x3020
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

HDMI Memory Map/Register Definition

Address: 12_0000h base + 3020h offset = 12_3020h

| | | | | | | | | |
|-------|----------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | - | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_PHY_I2CM_SLAVE_ADDR field descriptions

| Field | Description |
|----------|---|
| 7 - | This field is reserved. Reserved |
| 6-0 - | Slave address to be sent during read and write operations. The PHY Gen2 slave address is: 7'h69 The HEAC PHY slave address is: 7'h49 |

33.5.223 PHY I2C Address Configuration Register (HDMI_PHY_I2CM_ADDRESS_ADDR)

This register writes the address for read and writer operations.

- Address Offset: 0x3021
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3021h offset = 12_3021h

| | | | | | | | | |
|-------|---------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | address | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_PHY_I2CM_ADDRESS_ADDR field descriptions

| Field | Description |
|----------------|---|
| 7-0 address | Register address for read and write operations. |

33.5.224 PHY I2C Data Write Register 1 (HDMI_PHY_I2CM_DATAO_1_ADDR)

- Address Offset: 0x3022
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3022h offset = 12_3022h

HDMI_PHY_I2CM_DATAO_1_ADDR field descriptions

| Field | Description |
|--------------------|---|
| 7–0 datao[15:8] | MSB's of data to be written on register pointed by address [7:0]. |

33.5.225 PHY I2C Data Write Register 0 (HDMI_PHY_I2CM_DATAO_0_ADDR)

- Address Offset: 0x3023
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3023h offset = 12_3023h

HDMI_PHY_I2CM_DATAO_0_ADDR field descriptions

| Field | Description |
|-------------------|---|
| 7–0 datao[7:0] | LSB's of data to be written on register pointed by address [7:0]. |

33.5.226 PHY I2C Data Read Register 1 (HDMI_PHY_I2CM_DATAI_1_ADDR)

- Address Offset: 0x3024
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3024h offset = 12_3024h

HDMI_PHY_I2CM_DATAI_1_ADDR field descriptions

| Field | Description |
|--------------------|--|
| 7–0 datai[15:8] | MSB's of data read from the register pointed by address [7:0]. |

33.5.227 PHY I2C Data Read Register 0 (HDMI_PHY_I2CM_DATAI_0_ADDR)

- Address Offset: 0x3025
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3025h offset = 12_3025h

HDMI_PHY_I2CM_DATAI_0_ADDR field descriptions

| Field | Description |
|-------------------|--|
| 7–0 datai[7:0] | LSB's of data read from the register pointed by address [7:0]. |

33.5.228 PHY I2C Read/Write Operation (HDMI_PHY_I2CM_OPERATION_ADDR)

This register requests read and write operations from the I2C Master PHY. This register can only be written; reading this register always results in 00h. Writing 1'b1 simultaneously to read and write requests is considered a read request.

- Address Offset: 0x3026
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 3026h offset = 12_3026h

| | | | | | | | | |
|-------|----------|---|---|---|----------|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | Reserved | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_PHY_I2CM_OPERATION_ADDR field descriptions

| Field | Description |
|------------|-------------------------------------|
| 7–5 - | This field is reserved. Reserved |
| 4 write | Write operation request |
| 3–1 - | This field is reserved. Reserved |
| 0 read | Read operation request. |

33.5.229 PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_INT_ADDR)

This register contains and configures I2C master PHY done interrupt.

- Address Offset: 0x3027
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

HDMI Memory Map/Register Definition

Address: 12_0000h base + 3027h offset = 12_3027h

| | | | | | | | | |
|-------|----------|---|---|---|----------|-----------|----------------|-------------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | done_pol | done_mask | done_interrupt | done_status |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

HDMI_PHY_I2CM_INT_ADDR field descriptions

| Field | Description |
|---------------------|--|
| 7–4 - | This field is reserved. Reserved |
| 3 done_pol | Done interrupt polarity configuration Value after Reset: 1b |
| 2 done_mask | Done interrupt mask signal Value after Reset: 0b |
| 1 done_interrupt | Operation done interrupt bit.{done_interrupt =(done_mask==0b)&& (done_status==done_pol)}. Value after Reset: 0b |
| 0 done_status | Operation done status bit.Marks the end of a rd or write operation. Value after Reset: 0b |

33.5.230 PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_CTLINT_ADDR)

This register contains and configures the I2C master PHY error interrupts.

- Address Offset: 0x3028
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12_0000h base + 3028h offset = 12_3028h

| | | | | |
|-------|----------|-----------|----------------|-------------|
| Bit | 7 | 6 | 5 | 4 |
| Read | nack_pol | nack_mask | nack_interrupt | nack_status |
| Write | | | | |
| Reset | 1 | 0 | 0 | 0 |

| | | | | |
|-------|-----------------|------------------|-----------------------|--------------------|
| Bit | 3 | 2 | 1 | 0 |
| Read | arbitration_pol | arbitration_mask | arbitration_interrupt | arbitration_status |
| Write | | | | |
| Reset | 1 | 0 | 0 | 0 |

HDMI_PHY_I2CM_CTLINT_ADDR field descriptions

| Field | Description |
|---------------|--|
| 7 nack_pol | Not acknowledge error interrupt polarity configuration. Value after Reset: 1b |

Table continues on the next page...

HDMI_PHY_I2CM_CTLINT_ADDR field descriptions (continued)

| Field | Description |
|----------------------------|--|
| 6 nack_mask | Not acknowledge error interrupt mask signal Value after Reset: 0b |
| 5 nack_interrupt | Not acknowledge error interrupt bit.{nack_interrupt = nack_mask==0b} && (nack_status==nack_pol)). Value after Reset: 0b |
| 4 nack_status | Not acknowledge error status bit.Error on I2C not acknowledge. Value after Reset: 0b |
| 3 arbitration_pol | Arbitration error interrupt polarity configuration. Value after Reset: 1b |
| 2 arbitration_mask | Arbitration error interrupt mask signal. Value after Reset: 0b |
| 1 arbitration_interrupt | Arbitration error interrupt bit.{arbitration_interrupt = (arbitration_mask==0b)&& (arbitration_status==arbitration_pol)). Value after Reset: 0b |
| 0 arbitration_status | Arbitration error status bit. Error on master I2C protocol arbitration. Value after Reset: 0b |

33.5.231 PHY I2C Speed Control Register (HDMI_PHY_I2CM_DIV_ADDR)

This register wets the I2C Master PHY to work in either Fast or Standard mode.

- Address Offset: 0x3029
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12_0000h base + 3029h offset = 12_3029h

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |

HDMI_PHY_I2CM_DIV_ADDR field descriptions

| Field | Description |
|------------------|---|
| 7–4 - | This field is reserved. Reserved |
| 3–0 fast_mode | Sets the I2C Master to work in Fast Mode or Standard Mode (x implies that it can take any value) Value after Reset: 1011b |

Table continues on the next page...

HDMI_PHY_I2CM_DIV_ADDR field descriptions (continued)

| Field | Description |
|-------|---------------------|
| | 1xxxb Fast Mode |
| | 0xxxb Standard Mode |

33.5.232 PHY I2C Software Reset Register (HDMI_PHY_I2CM_SOFT_RSTZ_ADDR)

This register sets the I2C Master PHY software reset.

- Address Offset: 0x302A
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

The following *CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

The following are the I2C Master SCL clock settings:

- SS: Standard Speed
- FS: Fast Speed
- HCNT: SCL High Level counter
- LCNT: SCL Low Level counter

Address: 12_0000h base + 302Ah offset = 12_302Ah

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

HDMI_PHY_I2CM_SOFT_RSTZ_ADDR field descriptions

| Field | Description |
|------------------|--|
| 7-1 - | This field is reserved. Reserved |
| 0 i2c_softrst | I2C Master PHY Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b |

33.5.233 PHY I2C Slow Speed SCL High Level Control Register 1 (HDMI_PHY_I2CM_SS_SCL_HCNT_1_ADDR)

- Address Offset: 0x302B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 302Bh offset = 12_302Bh

| | | | | | | | | |
|-------|-------------------------|---|---|---|---|---|---|---|

33.5.247 Audio DMA Start Register (HDMI_AHB_DMA_CONF0)

This register contains the software reset bit for the audio FIFOs. It also configures operating modes of the AHB master.

- Address Offset: 0x3600
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3600h offset = 12_3600h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|-------------|----------|---|---|-----|--------------|----------------|------------|
| Read | sw_fifo_rst | Reserved | | | hbr | enable_hlock | incr_type[1:0] | burst_mode |
| Write | sw_fifo_rst | Reserved | | | hbr | enable_hlock | incr_type[1:0] | burst_mode |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_AHB_DMA_CONF0 field descriptions

| Field | Description |
|-----------------------|--|
| 7 sw_fifo_rst | This is the software reset bit for the audio and FIFOs clear. Writing 0'b does not result in any action. Writing 1'b to this register resets all audio FIFOs. Reading from this register always returns 0'b. |
| 6–5 - | This field is reserved. Reserved |
| 4 hbr | HBR packets enable. The HDMI TX sends the HBR packets. This bit is enabled when the audio frequency is higher than 192 KHz. If this bit is enabled, the number of channels configured in AHB_DMA_CONF1 is always 8. |
| 3 enable_hlock | Enable request of locked burst AHB mechanism. 1 Enables the usage of ohlock for master request to arbiter of a locked complete burst. 0 Disables request of locked burst AHB mechanism |
| 2–1 incr_type[1:0] | Forced size burst mode. 00 Corresponds to INCR4 fixed four beat incremental AHB burst mode. Only valid when burst_mode is high. 01 Corresponds to INCR8 fixed eight beat incremental AHB burst mode. Only valid when burst_mode is high. 10 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. 11 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. |
| 0 burst_mode | Burst mode bit 1 Forces the burst mode to be fixed beat incremental burst mode designated by the incr_type[1:0] signal. 0 Normal operation is unspecified length incremental burst. It corresponds to INCR AHB burst mode. |

33.5.248 AHB_DMA_START (HDMI_AHB_DMA_START)

The data_buffer_ready bit field signals the AHB audio DMA to start accessing system memory in order to fetch data samples to store in the FIFO. After the operation starts, a new request for a DMA start is ignored until the DMA is stopped or it reaches the end address. Only in one of these situations will a new start request be acknowledged.

The first DMA burst request after data_buffer_ready configuration uses the initial_addr[31:0] as the ohaddr[31:0] and the MBURSTLENGTH[10:0] = AUDIO_FIFO_DEPTH if AUDIO_FIFO_DEPTH < 1024 or MBURSTLENGTH[10:0] = 1024 if AUDIO_FIFO_DEPTH >= 1024.

- Address Offset: 0x3601
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3601h offset = 12_3601h

| 7–1 - | This field is reserved. Reserved |
| 0 data_buffer_ready | Data buffer ready |

33.5.249 Audio DMA Stop Register (HDMI_AHB_DMA_STOP)

The stop_dma_transaction bit field signals the AHB audio DMA to stop current memory access. After it stops, if a new start DMA operation is requested, the DMA engine restarts the memory access assuming the initial_addr[31:0] is programmed at AHB_DMA_STRADDR0 to AHB_DMA_STRADDR3.

- Address Offset: 0x3602
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

| 0 stop_dma_transaction | Stop DMA transaction |

33.5.250 Audio DMA FIFO Threshold Register (HDMI_AHB_DMA_THRSLD)

This register defines the FIFO medium threshold occupation value.

After the AHB master successfully completes a burst transaction, the FIFO may stay remain full until the data fetch interface requests samples. The sample request from the FIFO using the data fetch mechanism drops the number of samples stored in the audio FIFO.

As soon as the number of samples in the FIFO drops lower than the `fifo_threshold[7:0]`, the DMA engine requests a new burst of samples to the AHB master with a size (`MBURSTLENGTH[10:0]`) equal to `AUDIO_FIFO_DEPTH` minus `fifo_threshold[7:0]`.

Therefore, the `fifo_threshold[7:0]` is the medium number of samples that should be available in the audio FIFO across the DMA operation.

- Address Offset: 0x3603
- Size: 8 bits
- Value after Reset: 0x00

HDMI_AHB_DMA_STRADDR3 field descriptions

| Field | Description |
|-------------------------|--|
| 7-0 initial_addr[31] | Defines init_addr[31:24] for bits 7-0 to initiate DMA burst transactions |

33.5.255 Audio DMA Stop Address Register 0 (HDMI_AHB_DMA_STPADDR0)

This registers define the final_addr[31:0] used as the final point to the DMA burst read transactions.

Upon data_buffer_ready configuration, the DMA engine starts requesting burst reads from the external system memory. Each burst read can have a maximum theoretical length of 1024 words (due to the AMBA AHB specification restriction). As an example, if the first burst transaction of the AHB audio DMA has a length of 16, then the second burst starts at address $\text{ohaddr}[31:0] = \text{initial_addr}[31:0] + 16$ and has a length of $\text{MBURSTLENGTH}[10:0] = \text{AUDIO_FIFO_DEPTH} - \text{fifo_threshold}[7:0]$.

The DMA engine is responsible for incrementing the burst starting address and defining its corresponding burst length to reach the final_addr[31:0] address. The last burst request issued by the DMA engine takes into account that it should only request data until the final_addr[31:0] address (included) and for that should calculate the correct burst length.

After reaching the final_addr[31:0] address, the done interrupt is active to signal completion of DMA operation.

- Address Offset: 0x3608 to 0x360B
- Size: 8 bits per register

33.5.274 Main Controller Synchronous Clock Domain Disable Register (HDMI_MC_CLKDIS)

Main controller synchronous disable control per clock domain. Upon release of synchronous disable the corresponding sw reset NRZ request signal, to that domain, is toggled asking to the output for a synchronized active low reset to be generated to that domain.

- Address Offset: 0x4001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 4001h offset = 12_4001h

| | | | | | | | | |

| Field | Description |
|-----------------------|---|
| 1 tmdsclk_disable | TMDS clock synchronous disable signal. |
| 0 pixelclk_disable | Pixel clock synchronous disable signal. |

33.5.275 Main Controller Software Reset Register (HDMI_MC_SWRSTZREQ)

Main controller software reset request per clock domain. Writing zero to a bit of this register results in an NRZ signal toggle at sfrclk rate to an output signal that indicates a software reset request. This toggle must be used to generate a synchronized reset to the corresponding domain, with at least 1 clock cycle. Register defaults back to 0xFF.

- Address Offset: 0x4002
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 4002h offset = 12_4002h

33.5.306 CEC_CTRL (HDMI_CEC_CTRL)

CEC registers control the CEC feature that is implemented in HDMI TX. They perform various functions like controlling, monitoring, and buffering data for the transmitter and the receiver.

This register handles the main control of the CEC initiator.

- Address Offset: 0x7D00
- Size: 8 bits
- Value after Reset: 0x02
- Access: Read/Write

Address: 12_0000h base + 7D00h offset = 12_7D00h

| | | | | | | | | |
|-------|----------|---|---|---|---------|---------|-----------|------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | STANDBY | BC_NACK | FRAME_TYP | SEND |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

HDMI_CEC_CTRL field descriptions

| Field | Description |
|------------------|---|
| 7-5 - | This field is reserved. Reserved |
| 4 STANDBY | Standby bit 0 CEC controller responds the ACK to all messages. 1 CEC controller responds with ACK to all ping messages (only when the EOM is received) and responds with NACK to all other messages, generating wake-up status for selected opcodes. Attention that the NACK will only be posted on the last block of a frame. |
| 3 BC_NACK | Broadcast NACK bit 0 Reset by software to ACK the received broadcast message. 1 Set by software to NACK the received broadcast message. This bit holds till software resets. The broadcasts will be answered with 1'b0. It means the follower reject the message. |
| 2-1 FRAME_TYP | Frame Type bit 00 Signal Free Time = 3-bit periods. Previous attempt to send frame is unsuccessful. 01 Signal Free Time = 5-bit periods. New initiator wants to send a frame. 10 Signal Free Time = 7-bit periods. Present initiator wants to send another frame immediately after its previous frame. (spec CEC 9.1) 11 Illegal value. If software write this value, hardware will set the value to the default 2'b01. |
| 0 SEND | Send bit 0 Reset to 0 by hardware when the CEC transmission is done (no matter successful or failed). It can also work as an indicator checked by software to see whether the transmission is finished. 1 Set by software to trigger CEC sending a frame as an initiator. This bit keeps at 1 while the transmission is going on. |

33.5.307 CEC_STAT (HDMI_CEC_STAT)

This register indicates the status of CEC line. All bits are read only. When an event occurs, the corresponding bit will set to 1 for one SFR clock cycle only. Then, the bit automatically resets to 0. No software reset is required. Software can read the "stable" interrupts on IH_CEC_STAT0 register (this register has the same bit arrangement as CEC_STAT register).

- Address Offset: 0x7D01
- Size: 8 bits
- Value after Reset: N/A
- Access: Read

Address: 12_0000h base + 7D01h offset = 12_7D01h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|--------|------------|------------|----------|------|-----|------|
| Read | Reserved | WAKEUP | ERROR_FOLL | ERROR_INIT | ARB_LOST | NACK | EOM | DONE |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CEC_STAT field descriptions

| Field | Description |
|-----------------|---|
| 7 - | This field is reserved. Reserved |
| 6 WAKEUP | Follower received wake-up command (for follower only). |
| 5 ERROR_FOLL | An error is notified by a follower. Abnormal logic data bit error (for follower). |
| 4 ERROR_INIT | An error is detected on cec line (for initiator only). |
| 3 ARB_LOST | The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9). |
| 2 NACK | A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only). |
| 1 EOM | EOM is detected so that the received data is ready in the receiver data buffer (for follower only). |
| 0 DONE | The current transmission is successful (for initiator only). |

33.5.308 CEC_MASK (HDMI_CEC_MASK)

This read/write register masks/unmasks the interrupt events. When the bit is set to 1 (masked), the corresponding event will not trigger an interrupt signal at the system interface. When the bit is reset to 0, the interrupt event is unmasked.

- Address Offset: 0x7D02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D02h offset = 12_7D02h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|-------------|-----------------|-----------------|---------------|-----------|----------|-----------|
| Read | Reserved | WAKEUP_MASK | ERROR_FOLL_MASK | ERROR_INIT_MASK | ARB_LOST_MASK | NACK_MASK | EOM_MASK | DONE_MASK |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CEC_MASK field descriptions

| Field | Description |
|----------------------|---|
| 7 - | This field is reserved. Reserved |
| 6 WAKEUP_MASK | Follower wake-up signal mask |
| 5 ERROR_FOLL_MASK | An error is notified by a follower. Abnormal logic data bit error (for follower). |
| 4 ERROR_INIT_MASK | An error is detected on cec line (for initiator only). |
| 3 ARB_LOST_MASK | The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9). |
| 2 NACK_MASK | A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only). |
| 1 EOM_MASK | EOM is detected so that the received data is ready in the receiver data buffer (for follower only). |
| 0 DONE_MASK | The current transmission is successful (for initiator only). |

33.5.309 CEC_POLARITY (HDMI_CEC_POLARITY)

This register is readable and writable, which controls the polarity of the interrupt status register as well as the polarity of the interrupt signals at system interface.

- Address Offset: 0x7D03
- Size: 8 bits
- Value after Reset: 0x7F
- Access: Read/Write

Address: 12_0000h base + 7D03h offset = 12_7D03h

| | | | | | | | | |
|-------|---|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

HDMI_CEC_POLARITY field descriptions

| Field | Description |
|-----------------|-------------------------------------|
| 7 - | This field is reserved. Reserved |
| 6 WAKEUP_POL | Follower wakeup signal polarity |

Table continues on the next page...

HDMI_CEC_POLARITY field descriptions (continued)

| Field | Description |
|---------------------|---|
| 5 ERROR_FOLL_POL | CEC line error polarity (for follower only) |
| 4 ERROR_INIT_POL | CEC line error polarity (for initiator only) |
| 3 ARB_LOST_POL | Initiator Arbitration lost signal polarity |
| 2 NACK_POL | Frame NACK signal polarity |
| 1 EOM_POL | EOM detect signal polarity (follower only) |
| 0 DONE_POL | Current transmission success or not signal polarity |

33.5.310 CEC_INT (HDMI_CEC_INT)

This register is read only. Each bit of the register is output at the system interface. The output signals hold the active interrupt state (high or low) for only one SFR clock cycle. Then the hardware resets the bit to an inactive state. Software can read the "stable" interrupts on the IH_CEC_STAT0 register at address 0x0106 (this register has the same bit arrangement as the CEC_STAT register).

The functional formula for the interrupts is:

$$\text{CEC_INT} = (\text{CEC_MASK} == 0b) \ \&\& \ (\text{CEC_STATUS} == \text{CEC_POLARITY})$$

- Address Offset: 0x7D04
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D04h offset = 12_7D04h

| | | | | |

| 2 NACK_INT | Initiator Arbitration lost interrupt |
| 1 EOM_INT | Frame NACK interrupt |
| 0 DONE_INT | EOM detect interrupt (for follower only) |

33.5.311 CEC_ADDR_L (HDMI_CEC_ADDR_L)

CEC_ADDR_L and CEC_ADDR_H registers indicate the logical address(es) allocated to the CEC device. The logical address mappings are shown in [CEC_ADDR_L \(HDMI_CEC_ADDR_L\)](#) and [CEC_ADDR_H \(HDMI_CEC_ADDR_H\)](#). This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

- Address Offset: 0x7D05
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D05h offset = 12_7D05h

| 0 CEC_ADDR_H0 | Logical address 8 - Playback Device 2 |

33.5.313 CEC_TX_CNT (HDMI_CEC_TX_CNT)

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the transmitter data buffer.

When the value is zero, the CEC controller ignores the send command triggered by software. When the transmission is done (no matter success or not), the current value is held until it is overwritten by software.

- Address Offset: 0x7D07
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D07h offset = 12_7D07h

| | | | | | | | | |

| 7-0 CEC_TX_DATA | Header block in CEC_TX_DATA0 Data blockn in CEC_TX_DATA _n |

33.5.316 CEC_RX_DATA (HDMI_CEC_RX_DATA_n)

These registers (8 bit each) are the buffers used for storing the received data (including header and data blocks).

- Address Offset: 0x7D20 .. 0x7D2F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D20h offset + (1d × i), where i=0d to 15d

| | | | | | | | | |
|-------|-------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | CEC_RX_DATA | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CEC_RX_DATA_n field descriptions

| Field | Description |
|--------------------|---|
| 7-0 CEC_RX_DATA | Header block in CEC_RX_DATA0 Data blockn in CEC_RX_DATA _n |

33.5.317 CEC_LOCK (HDMI_CEC_LOCK)

- Address Offset: 0x7D30
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D30h offset = 12_7D30h

| | | | | | | | | |
|-------|----------|---|---|---|---|---|---|---------------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | | | | | | LOCKED_BUFFER |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_CEC_LOCK field descriptions

| Field | Description |
|--------------------|--|
| 7-1 - | This field is reserved. Reserved |
| 0 LOCKED_BUFFER | When a frame is received, this bit would be active. The CEC controller answers to all the messages with NACK until the CPU writes it to '0'. |

33.5.318 CEC_WKUPCTRL (HDMI_CEC_WKUPCTRL)

- Address Offset: 0x7D31
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status:

Wakeupstatus is 1 when:

received opcode is 0x04 and opcode0x04en is 1 or received opcode is 0x0D and opcode0x0Den is 1 or received opcode is 0x41 and opcode0x41en is 1 or received opcode is 0x42 and opcode0x42en is 1 or received opcode is 0x44 and opcode0x44en is 1 or received opcode is 0x70 and opcode0x70en is 1 or received opcode is 0x82 and opcode0x82en is 1 or received opcode is 0x86 and opcode0x86en is 1

Wakeupstatus is 0 when none of the previous conditions are true.

This formula means that the wake-up status (on CEC_STAT[6] register) is only '1' if the opcode[7:0] received is equal to one of the defined values and the corresponding enable bit of that defined value is set to '1'.

Address: 12_0000h base + 7D31h offset = 12_7D31h

| | | | | |
|-------|--------------|--------------|--------------|--------------|
| Bit | 7 | 6 | 5 | 4 |

| 0 OPCODE0x04en | OPCODE 0x04 wake up enable |

33.5.319 I2CM_SLAVE (HDMI_I2CM_SLAVE)

I2C Master Registers (E-DDC) registers are responsible for the Master's coordination with the Slave, by coordinating the Slave address, data identification, transaction status, acknowledgement, and reset functions.

- Address Offset: 0x7E00
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E00h offset = 12_7E00h

| | | | | | | | | |
|-------|----------|---|----------------|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | Reserved | | slaveaddr[6:0] | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_I2CM_SLAVE field descriptions

| Field | Description |
|-----------------------|---|
| 7 - | This field is reserved. Reserved |
| 6–0 slaveaddr[6:0] | Slave address to be sent during read and write normal operations. |

33.5.320 I2CM_ADDRESS (HDMI_I2CM_ADDRESS)

- Address Offset: 0x7E01
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E01h offset = 12_7E01h

| | | | | | | | | |
|-------|--------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

HDMI_I2CM_ADDRESS field descriptions

| Field | Description |
|---------------------|---|
| 7–0 address[7:0] | Register address for read and write operations. |

33.5.321 I2CM_DATAO (HDMI_I2CM_DATAO)

- Address Offset: 0x7E02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E02h offset = 12_7E02h

HDMI_I2CM_DATAO field descriptions

| Field | Description |
|-------------------|---|
| 7–0 datao[7:0] | Data to be written on register pointed by address[7:0]. |

33.5.322 I2CM_DATAI (HDMI_I2CM_DATAI)

- Address Offset: 0x7E03
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7E03h offset = 12_7E03h

HDMI_I2CM_DATAI field descriptions

| Field | Description |
|-------------------|--|
| 7–0 datai[7:0] | Data read from register pointed by address[7:0]. |

33.5.323 I2CM_OPERATION (HDMI_I2CM_OPERATION)

Read and write operation request. This register can only be written, reading this register will always result in 00h. Writing 1'b1 simultaneously to rd, rd_ext and wr requests is considered as a read (rd) request.

- Address Offset: 0x7E04
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 7E04h offset = 12_7E04h

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|---|---|----|----------|---|--------|----|
| Read | Reserved | | | wr | Reserved | | rd_ext | rd |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

HDMI_I2CM_OPERATION field descriptions

| Field | Description |
|-------------|---|
| 7–5 - | This field is reserved. Reserved |
| 4 wr | Write operation request. |
| 3–2 - | This field is reserved. Reserved |
| 1 rd_ext | After writing 1'b1 to rd_ext bit a extended data read operation is started (E- DDC read operation). |
| 0 rd | Read operation request. |

33.5.324 I2CM_INT (HDMI_I2CM_INT)

This register contains and configures I2C master done interrupt.

- Address Offset: 0x7E05
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

HDMI Memory Map/Register Definition

Address: 12_0000h base + 7E05h offset = 12_7E05h

| | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

HDMI_I2CM_INT field descriptions

| Field | Description |
|---------------------|--|
| 7–4 - | This field is reserved. Reserved |
| 3 done_pol | Done interrupt polarity configuration. |
| 2 done_mask | Done interrupt mask signal. |
| 1 done_interrupt | Operation done interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {done_interrupt = (done_mask==0b) && (done_status==done_pol)}. |
| 0 done_status | Operation done status bit. Marks the end of a rd or write operation. |

33.5.325 I2CM_CTLINT (HDMI_I2CM_CTLINT)

This register contains and configures I2C master arbitration error and not acknowledge error interrupt.

- Address Offset: 0x7E06
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12_0000h base + 7E06h offset = 12_7E06h

| | | | | |
|-------|----------|-----------|----------------|-------------|
| Bit | 7 | 6 | 5 | 4 |

HDMI_I2CM_CTLINT field descriptions

| Field | Description |
|---------------|---|
| 7 nack_pol | Not acknowledge error interrupt polarity configuration. |

Table continues on the next page...

HDMI_I2CM_CTLINT field descriptions (continued)

| Field | Description |
|----------------------------|---|
| 6 nack_mask | Not acknowledge error interrupt mask signal. |
| 5 nack_interrupt | Not acknowledge error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {nack_interrupt = (nack_mask==0b) && (nack_status==nack_pol)}. |
| 4 nack_status | Not acknowledge error status bit. Error on I2C not acknowledge. |
| 3 arbitration_pol | Arbitration error interrupt polarity configuration. |
| 2 arbitration_mask | Arbitration error interrupt mask signal. |
| 1 arbitration_interrupt | Arbitration error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {arbitration_interrupt = (arbitration_mask==0b) && (arbitration_status==arbitration_pol)}. |
| 0 arbitration_status | Arbitration error status bit. Error on master I2C protocol arbitration. |

33.5.326 I2CM_DIV (HDMI_I2CM_DIV)

This register configures the division relation between master and scl clock.

- Address Offset: 0x7E07
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12_0000h base + 7E07h offset = 12_7E07h

HDMI_I2CM_SOFTTRSTZ field descriptions

| Field | Description |
|------------------|--|
| 7-1 - | This field is reserved. Reserved |
| 0 i2c_softrst | I2C Master Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b |

33.5.329 I2CM_SEGPTR (HDMI_I2CM_SEGPTR)

This register configures the segment pointer for extended RD/WR request.

- Address Offset: 0x7E0A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

The following *CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Address: 12_0000h base + 7E0Ah offset = 12_7E0Ah

| | | | | | | | | |
|-------|-------------|---|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 7–0 i2cmp_fs_scl_lcnt[7:0] | Value after Reset: 8'h24 |

33.5.338 BASE_POINTER_ADDR (HDMI_BASE_POINTER_ADDR)

The I2C Slave Registers allow register memory pagination, and function in the incremental burst operation mode that increases the data throughput when consecutive addressed registers need to be read or write.

The I2C base pointer operation mode is aimed to allow register memory pagination. As long as this operational mode is enabled the value written to this register will be used as the seven most significant bits of the internal Special Function Register address interface (sfraddr[14:8]) for all read or write operations. I2C data transfer protocol used shall be the 7-bit addressed as defined in the section 9 of the I2C-bus Specification, version 2.1.

- Address Offset: 0x7F00
- Size: 8 bits

HDMI Memory Map/Register Definition

- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7F00h offset = 12_7F00h

| | | | | | | | | |
|-------|--------------|-----------------------------|---|---|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | en_base_ | base_pointer_base_addr[6:0] | | | | | | |

HDMI_BASE_POINTER_ADDR field descriptions

| Field | Description |
|--|--|
| 7 en_base_ pointer_addr | Enables the base pointer operation mode. |
| 6–0 base_pointer_ base_addr[6:0] | Defines the base address for base pointer operation mode. They represent the address bits [14:8] |

Chapter 34

HDMI 3D Tx PHY (HDMI_PHY)

34.1 Overview

34.1.1 General Description

The HDMI 3D Tx PHY (HDMI_PHY) is the physical layer of a single-link HDMI transmitter interface and comprises three line drivers for data transmission and an additional line driver for clock transmission. The HDMI_PHY is designed to perform the serialization and transmission of video data and control information through an HDMI interface. It interfaces with an HDMI Tx link controller through a common graphic controller interface supporting 30- or 60-bit data transfers. A clock line driver is used for reference clock transmission.

34.1.2 Applications

The HDMI_PHY is targeted to digital video/audio transmission for high resolution display applications, supporting major display formats up to 1080 i/p in DTV applications and QXGA in graphic display applications, with true-color or deep-color resolutions. The HDMI_PHY supports 3D video formats. At maximum pixel rate, the HDMI channel bit rate is 3.4 Gbps, providing a maximum throughput of 9.2 Gbps.

The HDMI_PHY is an ideal solution for implementing the physical layer of a high-reliability digital video/audio interface based on HDMI technology, with reduced line count and minimum cable-wire and EMI shielding requirements. The HDMI_PHY delivers the bandwidth needed in every time mode that demands high resolution panels, while keeping clock sources at a low frequency.

The figure below shows a typical application for HDMI_PHY.

Figure 34-1. Typical Application for HDMI 3D Tx PHY

34.1.3 Standards Compliance

The HDMI_PHY is fully compliant with all the required specifications of the following standards:

- *High-Definition Multimedia Interface Specification*, Version 1.4a
- *Digital Visual Interface*, Revision 1.0
- *HDMI Compliance Test Specification*, Version 1.4a

34.1.4 Features

The HDMI_PHY provides the following features:

- Support for up to 720p at 100 Hz and 720i at 200 Hz or 1080p at 60 Hz and 1080i/720i at 120 Hz HDTV display resolutions and up to QXGA graphic display resolutions
- Support for 3D video formats
- Link controller flexible interface with 30- or 60-bit SDR data access
- Up to 9.2 Gbps aggregate bandwidth
- Driver with pre-emphasis and edge rate control for extra-long cable support
- Programmable source terminations
- HPD input analog comparator
- Rx sensing
- 13.5-266 MHz input reference clock

- 50% duty-cycle output clock
- Embedded Tx scope
- Embedded A/D converter and analog testbus for ATE testing
- Built-in pattern generator
- Small core area
- Low power consumption

34.1.5 HDMI 3D Tx PHY System-Level Overview

This section provides a system-level overview of the HDMI 3D Tx PHY.

34.1.5.1 System-Level Block Diagram

The figure below shows a system-level block diagram of the HDMI Tx System.

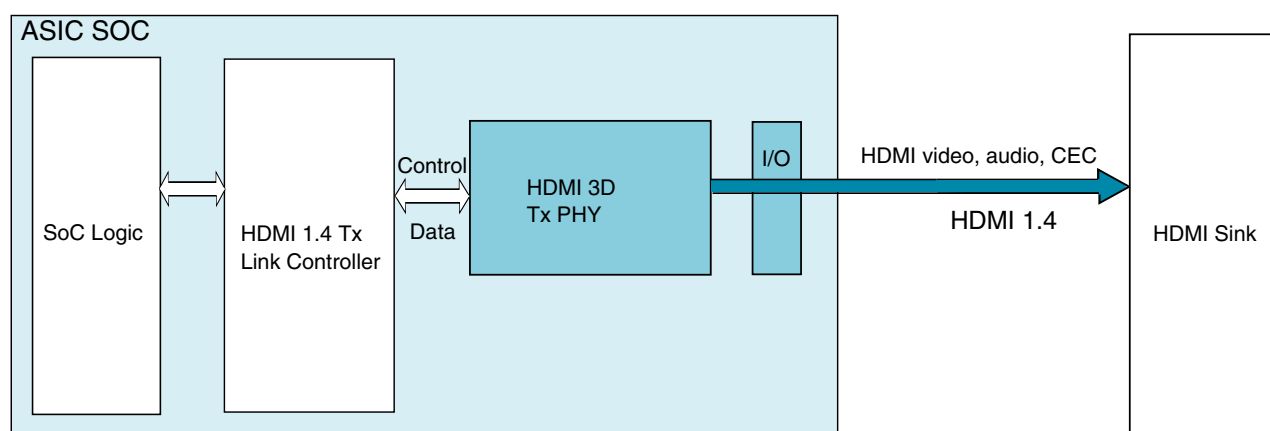

Figure 34-2. HDMI Tx System-Level Block Diagram

The HDMI_PHY macro interfaces with the HDMI Tx link controller, which provides control signals and video data to be transmitted through the TMDS lanes. Analog I/O's interface with the external world.

34.1.5.2 HDMI 3D Tx PHY

The HDMI 3D Tx PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source).

For a functional block diagram and a functional description of the HDMI 3D Tx PHY, see [Functional Description](#).

34.1.5.2.1 Interfaces

The HDMI interface on the HDMI_PHY block is defined by the TMDS differential lanes and the HPD/DDCCEC connections. HDMI video data is provided through three differential TMDS pairs for data and one TMDS differential pair for clock. HPD/DDC_CEC enables detection of the HDMI sink. These signals interface the external world and connect to the HDMI connector.

On the system interface, the HDMI_PHY connects to the HDMI Tx link controller. This block provides an input reference clock to the PHY (pixel clock). Based on the defined video mode, a pixel repetition clock and a TMDS word clock are output to the controller. The controller then generates video data on this TMDS word clock and outputs both data and clock to the HDMI_PHY. Data is then serialized and sent to the HDMI interface.

In addition, the system side includes one standard I²C interface for configuration and testability of the PHY. Other signals correspond to control logic and are either input to the PHY or provided by the PHY to the controller block for observability.

34.1.5.3 HDMI 1.4 I/O Pads

HDMI 3D Tx PHY provides a set of analog ESD pads for use.

34.1.5.3.1 I/O Pads Description

HDMI 3D Tx PHY I/O pads are provided as follows:

- Pad order: VPH, VP, GD, VPH, VP, GD, VPH, VP, GD, HDMI_TX_CLK_P, HDMI_TX_CLK_N, GD, HDMI_TX_DATA0_N, HDMI_TX_DATA0_P, GD, HDMI_TX_DATA1_N, HDMI_TX_DATA1_P, GD, HDMI_TX_DATA2_N, HDMI_TX_DATA2_P, GD, VP, VPH, REXT, HDMI_TX_HPD, HDMI_TX_DDC_CEC

As shown in the figure below, for maximum performance, HDMI 3D Tx PHY I/O pads contain decoupling capacitance between VP and GD and a filter between VP and VP_FILT (one for each VP_FILT signal).

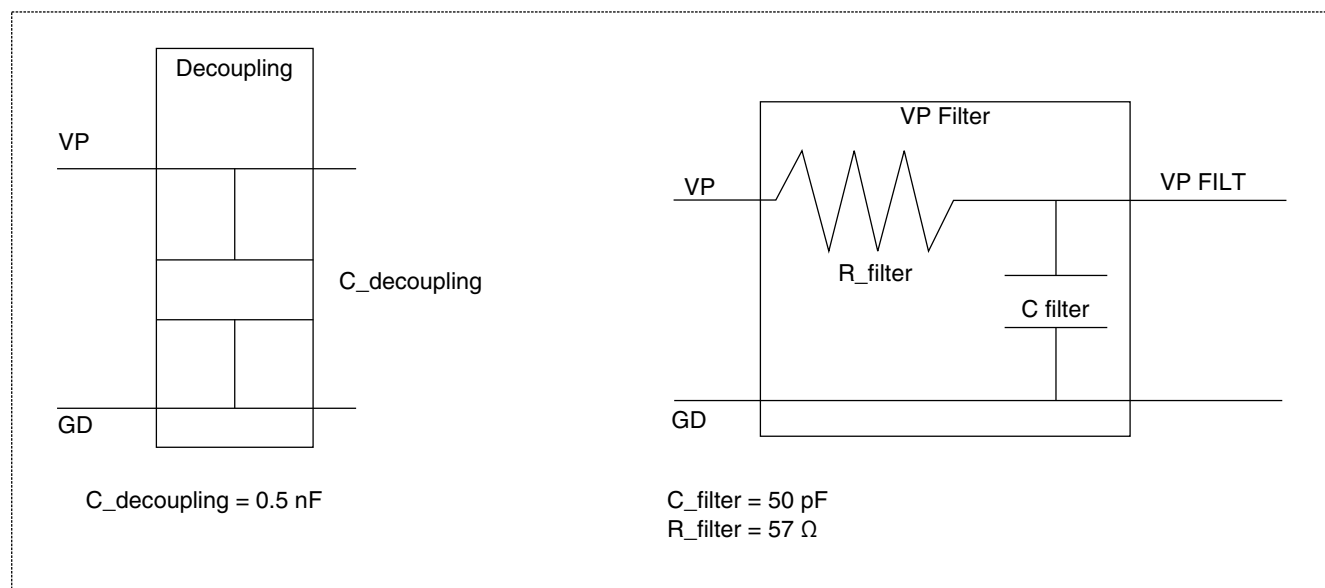

Figure 34-3. I/O Pads: Decoupling Capacitance Between VP and GD, Filter Between VP and VP_FILT

34.2 External Signals

The table found here describes the external signals of HDMI.

Table 34-1. HDMI External Signals

| Signal | Description | Pad | Mode | Direction |
|--------------------------------|----------------------------------|-----------|-----------|-----------|
| HDMI_TX_CEC_LINE (CEC_LINE) | CEC line between source and sink | EIM_A25 | ALT6 | I/O |
| | | KEY_ROW2 | ALT6 | |
| HDMI_TX_CLK_N (CLK_N) | Negative Clock Signal | HDMI_CLKM | No Muxing | I |
| HDMI_TX_CLK_P (CLK_P) | Positive Clock Signal | HDMI_CLKP | No Muxing | I |
| HDMI_TX_DATA0_N (DATA0_N) | Negative Data Signal 0 | HDMI_D0M | No Muxing | I/O |
| HDMI_TX_DATA0_P (DATA0_P) | Positive Data Signal 0 | HDMI_D0P | No Muxing | I/O |
| HDMI_TX_DATA1_N (DATA1_N) | Negative Data Signal 1 | HDMI_D1M | No Muxing | I/O |
| HDMI_TX_DATA1_P (DATA1_P) | Positive Data Signal 1 | HDMI_D1P | No Muxing | I/O |
| HDMI_TX_DATA2_N (DATA2_N) | Negative Data Signal 2 | HDMI_D2M | No Muxing | I/O |

Table continues on the next page...

Table 34-1. HDMI External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|------------------------------|------------------------|-------------|-----------|-----------|
| HDMI_TX_DATA2_P (DATA0_P) | Positive Data Signal 2 | HDMI_D2P | No Muxing | I/O |
| HDMI_TX_DDC_CEC (DDC_CEC) | CEC Signal | HDMI_DDCCEC | No Muxing | I/O |
| HDMI_TX_DDC_SCL (DDC_SCL) | SCL Signal | EIM_EB2 | ALT4 | I/O |
| | | KEY_COL3 | ALT2 | |
| HDMI_TX_DDC_SDA (DDC_SDA) | SDA Signal | EIM_D16 | ALT4 | I/O |
| | | KEY_ROW3 | ALT2 | |
| HDMI_TX_HPD (HPD) | HPD Signal | HDMI_HPD | No Muxing | I/O |

34.2.1 Top-Level I/O Diagram

The figure below shows the HDMI 3D Tx PHY top-level signals.

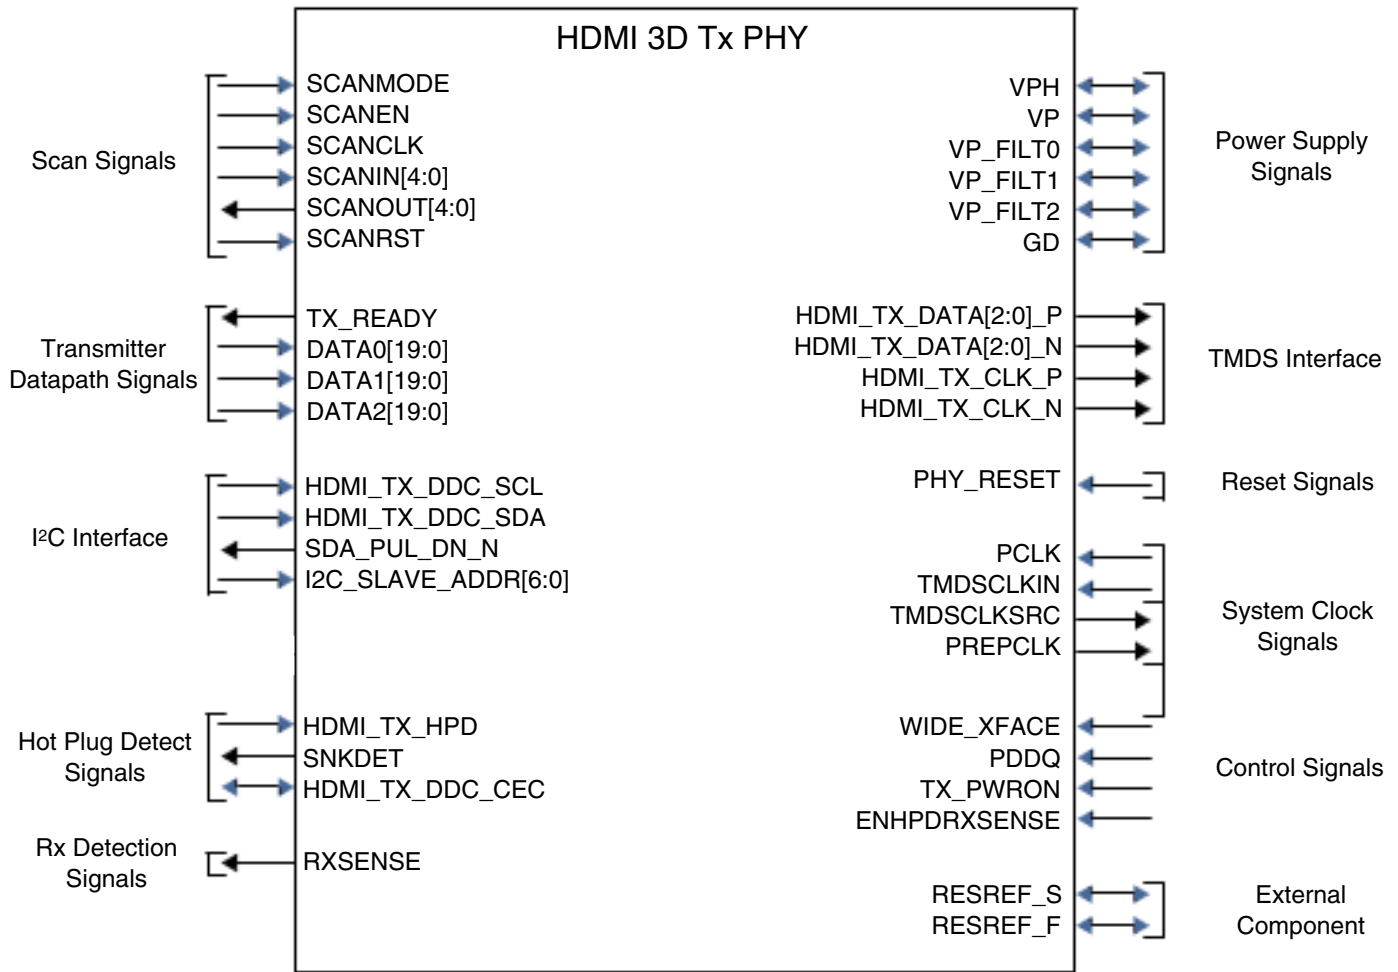

Figure 34-4. Top-Level I/O Diagram

34.2.2 Top -Level Signal Descriptions

This section describes the top-level signals.

In addition to describing the function of each signal, the signal descriptions include the following information:

- **Voltage range:** Describes the voltage range expected on this pin.
- **Synchronous:** Indicates that the signal is asserted or deasserted with respect to a clock edge.
- **Asynchronous:** Indicates that the signal is not asserted or deasserted with respect to a clock edge.

34.2.2.1 TMDS Interface

The table below describes the Transmission Minimized Differential Signaling (TMDS) interface signals.

Table 34-2. TMDS Interface

| Signal | I/O | Description |
|---------------------|-----|---|
| HDMI_TX_DATA[2:0]_P | O | Function: Positive TMDS differential line driver data output for data channels 0, 1, and 2. Voltage range: For the permitted voltage range, refer to <i>High-Definition Interface Specification</i> , Version 1.4, "Electrical Specification" section. Active state: N/A Synchronous to: N/A |
| HDMI_TX_DATA[2:0]_N | O | Function: Negative TMDS differential line driver data output for data channels 0, 1, and 2. Voltage range: For the permitted voltage range, refer to <i>High-Definition Interface Specification</i> , Version 1.4, "Electrical Specification" section. Active state: N/A Synchronous to: N/A |
| HDMI_TX_CLK_P | O | Function: Positive TMDS differential line driver clock output Voltage range: For the permitted voltage range, refer to <i>High-Definition Multimedia Interface Specification</i> , Version 1.4, "Electrical Specification" section. Active state: N/A Synchronous to: N/A |
| HDMI_TX_CLK_N | O | Function: Negative TMDS differential line driver clock output Voltage range: For the permitted voltage range, refer to <i>High-Definition Multimedia Interface Specification</i> , Version 1.4, "Electrical Specification" section. Active state: N/A Synchronous to: N/A |

34.2.2.2 Reset Signals

The table below describes the reset signals.

Table 34-3. Reset Signals

| Signal | I/O | Description |
|-----------|-----|---|
| PHY_RESET | I | Function: PHY reset. This signal places the digital section of the macro into a reset state. Voltage range: 0-VP Active state: High Synchronous to: Asynchronous |

34.2.2.3 External Component

The table below describes the top-level signals that connect to an external component.

Table 34-4. External Component

| Signal | I/O | Description |
|----------|-----|---|
| RESREF_S | I/O | Function: 1600- precision resistor to ground. During resistor tuning, current is forced through the external resistor using RESREF_F, while the induced voltage is sensed on RESREF_S. Voltage range: N/A Active state: N/A Synchronous to: Asynchronous |
| RESREF_F | I/O | Function: Reference resistor connection Voltage range: N/A Active state: N/A Synchronous to: Asynchronous |

34.3 Functional Description

This section describes the functional architecture of the HDMI 3D Tx PHY.

34.3.1 Functional Overview

The figure found in this section shows a functional block diagram of the HDMI_PHY.

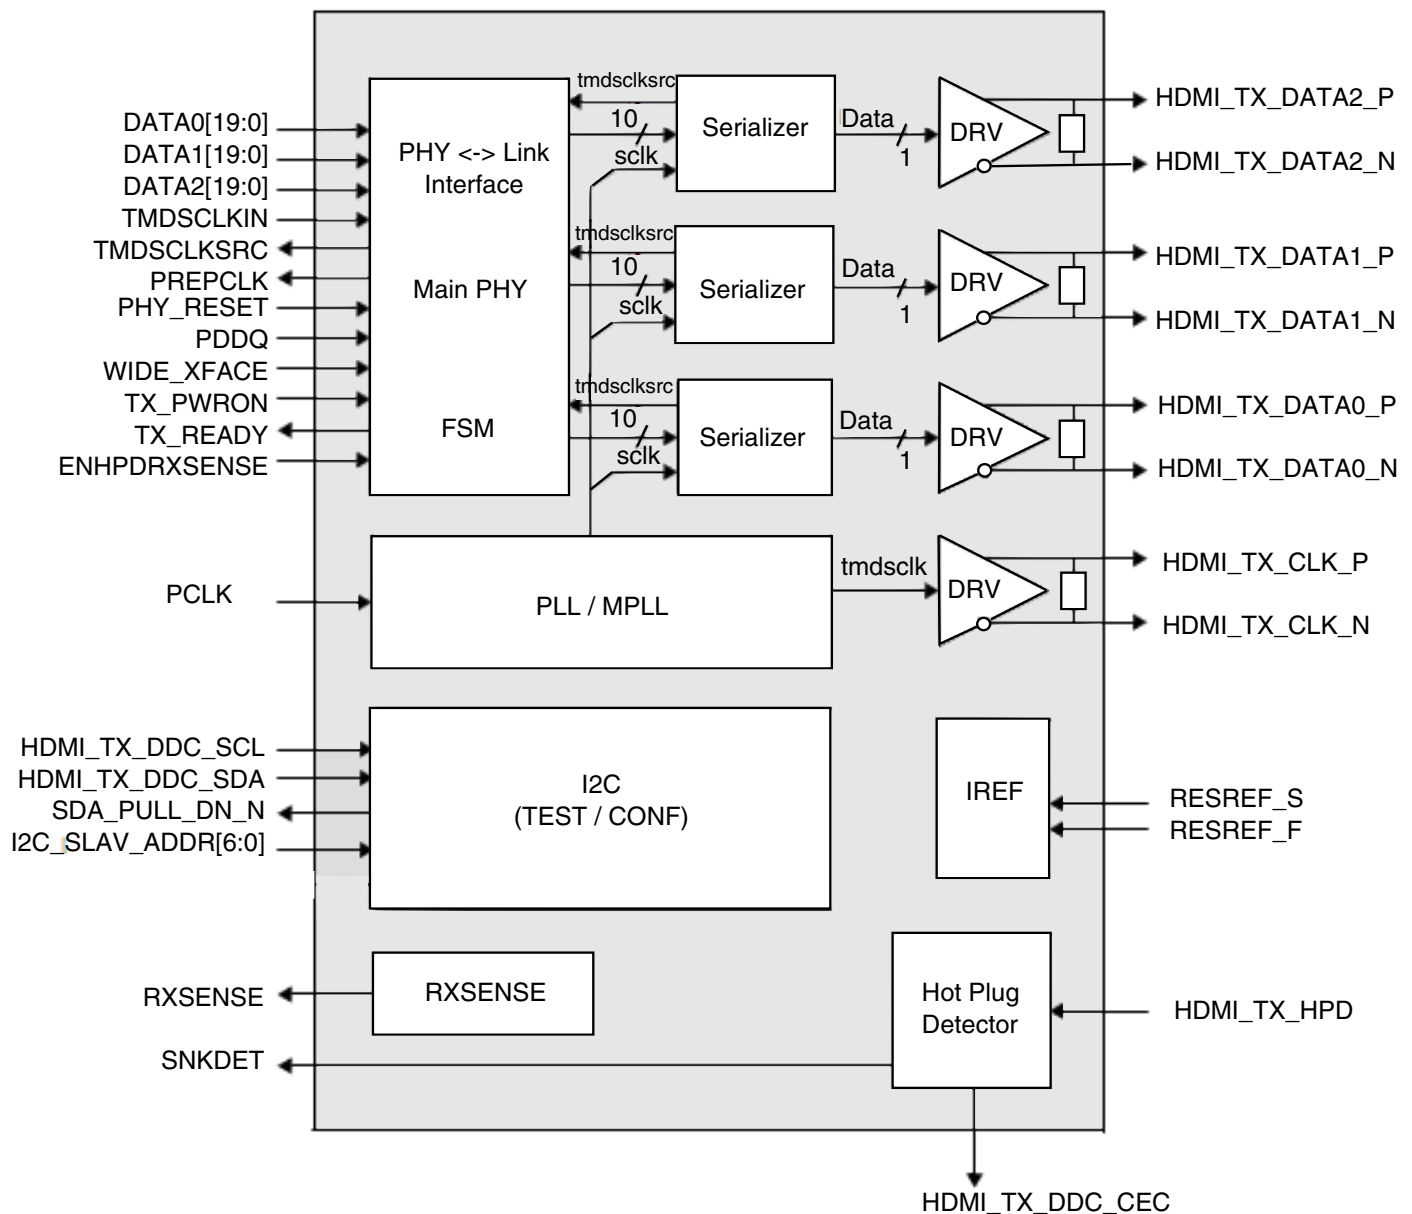

Figure 34-5. HDMI 3D Tx PHY Functional Block Diagram

The HDMI_PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source), capable of encoding and transmitting high-speed data streams carrying RGB video, audio, and control information. The HDMI Link Controller interface conforms to a 30- or 60-bit synchronous data interface (DATA0[19:0], DATA1[19:0], DATA2[19:0]).

The PHY includes two PLLs that synthesize the high-speed serial bit clock (required by the transmitter) from a reference pixel clock with a frequency of 13.5-266 MHz, for a transmitter capable of transmitting up to 9.2 Gbps using three lanes.

The HDMI_PHY drives audio and video across three TMDS data channels. Each serial TMDS link has a data rate range of 0.25-3.4 Gbps. The HDMI_PHY also drives the TMDS clock at 1/10th of the serial data rate with a frequency range of 25-266 MHz.

Within the HDMI_PHY, additional support blocks exist: the Bandgap block (for blocks biasing), the Resistor Calibration block, the ADC, and the analog test bus.

The HDMI_PHY accepts an input pixel clock (PCLK) with a frequency range of 13.5-266 MHz and accepts three channels of parallel data (TXDATA0[19:0], TXDATA1[19:0], TXDATA2[19:0]) that is synchronous with the TMDSCCLKIN input clock. The TMDSCCLKIN clock has a frequency range of 12.5-266MHz.

The TMDSCCLKSRC clock output should be used by the HDMI transmitter controller as the source for TMDSCCLKIN. The relation between TMDSCCLKSRC and TMDSCCLKIN should be constant between resets.

The HDMI_PHY's status and configuration is accessed through its I²C interface. In Scan mode of operation, SCANCLK is bypassed to all PHY output clocks.

PLL/MPLL Operation

The PLL/MPLL can be configured in Coherent mode or Non-Coherent mode (default). In Coherent mode, the TMDS clock is the MPLL feedback clock, which is coherent with the MPLL's high-speed output clock, because both clocks are shaped by the MPLL response. In Non-Coherent mode, the TMDS clock is the MPLL reference clock, which is not coherent with the MPLL's high-speed output clock.

Driver Operation

The driver differential source termination, edge rate, pre-emphasis, and voltage level can be configured for maximum performance.

34.3.2 Operating Modes

This section describes various operating modes of the HDMI_PHY.

The HDMI_PHY can be placed in two different operating modes: Power-Down and Active.

The PHY_RESET signal is used to place the digital section of the IP in a well-defined state. Reset is active when the PHY_RESET signal is asserted high. PHY_RESET assertion also clears the configuration registers. Through the control registers, assertion of a soft reset to the macro is possible. This soft reset clears all system FSMs except I²C and control registers.

For each separate video mode in which the HDMI_PHY is set to transmit, due to different operating frequency, color depth and pixel repetition that characterizes each one, you might need to configure the PHY block for correct operation and optimized performance. It is recommended that PHY configuration through the I²C interface be done while the PHY is in Power-down mode. Configuration involves programming the PLL/MPLL internal blocks as well as the analog drivers' source termination value and edge rate control, for example. This programming is done through the I²C interface. For more information about the I²C interface, see [I2C Interface Signals](#), for information about the PLL/MPLL configurations that must be made for each video mode of operation, see [PLL/MPLL Generic Configuration Settings](#), and for information about the driver configurations, see [Control Registers](#) and [Appendix A: Driver Voltage Level Configuration](#).

34.3.2.1 Power-Down Mode

This mode is the lowest power consumption mode. The PHY enters this mode when the TX_PWRON and ENHPDRXSENSE signals are set to 1'b0 and the PDDQ and PHY_RESET signals are set to 1'b1.

This mode is characterized by having all analog blocks disabled and digital logic quiet. Current consumption in this mode corresponds to the analog blocks standby current and digital logic leakage current.

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). If this sequence is not followed, TX_READY is not set to 1'b0, and the PHY remains in Active mode.

During Power-down mode, the ENHPDRXSENSE control signal can be set to 1'b1, enabling the HPD and RXSENSE-related circuitry. This setting enables the link controller to observe when an HDMI Rx is connected to the Tx and to power up the HDMI 3D Tx PHY after detecting the Rx.

During Power-down mode, if ENHPDRXSENSE is enabled, it is recommended that source terminations on both data and clock lines are enabled by setting tx_rescal[6:0] and ck_rescal[6:0] to 7'b1111111 on registers

0x04 and 0x05, respectively. Because the analog driver within the macro is disabled, enabling the source terminations will help pull-down the floating TMDS data/clock lines to a voltage level that will guarantee proper RXSENSE operation and output signaling when the Rx connects/disconnects from the PHY.

34.3.2.2 Active Mode

Active mode is the normal operational mode. To start processing received data from the link controller interface, the macro must first reach this state. The PHY is ready to transmit when TX_READY is asserted high.

In this state, the interface signals (DATA0[19:0], DATA1[19:0], DATA2[19:0]) are sent to the HDMI interface. Data is transferred according to the HDMI specification.

After entering Active mode, the HDMI Tx macro starts serially transmitting data received from the link controller to the TMDS interface. The way in which input data is encoded (depends on whether data corresponds to Video Data Period, Data Island Period, or Control Periods) depends on the HDMI protocol sequence. Data encoding is performed by the Link controller layer.

While operating in Active mode, the HDMI_PHY operates in one of the following modes (as defined in the HDMI specification, and as shown in the figure below):

- Video Data Period
- Data Island Period
- Control Period

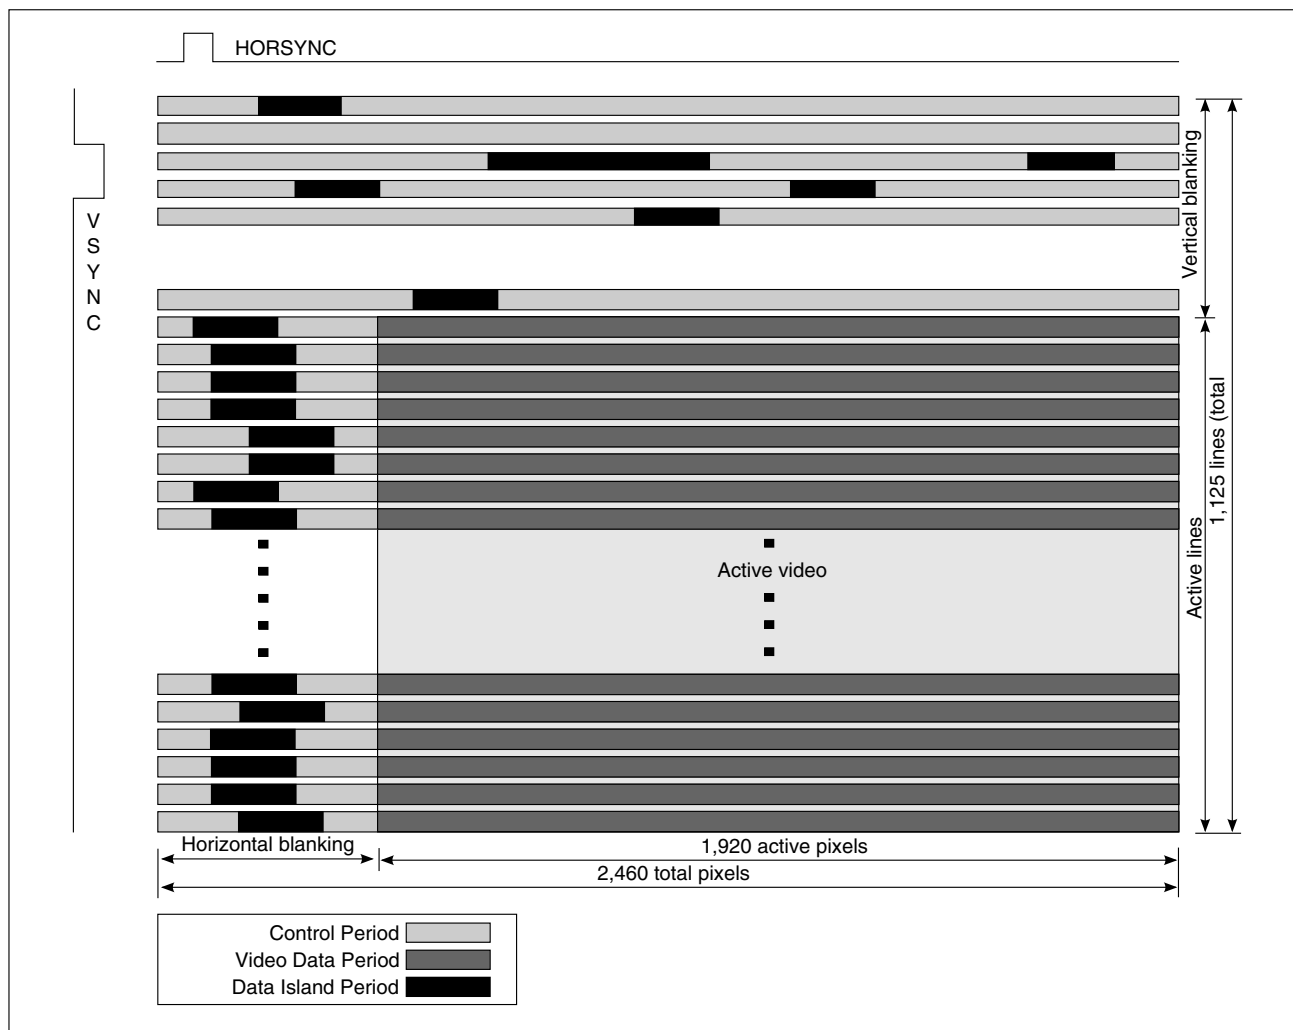

Figure 34-6. Active Mode

Video Data Period is used for the transmission of active pixel data. Transition Minimized (TMDS) data coding (8B10B) is used for 8-bit data transfers. In Deep-color modes, pixel data words are first packed in 8-bit multiple data groups. These groups are then fragmented into 8-bit length words for TMDS encoding.

Data Island Period is used for audio or other auxiliary data information transmission. Data is transferred in packet format using a similar Transition Minimized coding, in this case a TMDS Error Reduction Coding (TERC4). This is a 4B10B code.

Finally, Control Period is used when non-active video/audio or other auxiliary information needs to be transmitted. Only control information is transmitted in this mode. In Control Periods, data is transferred using a Transition Maximized (also TMDS) data

coding, in a form of 2B10B code. This property is very useful to enable proper word alignment on the sink (receiver) side. A Control Period is always entered between any other two periods that are not Control Periods.

34.3.2.2.1 Wide Interface Mode

To support the full HDMI bandwidth requirement, each of the three channels accepts 9-bit data and clock at a maximum rate of 340 MHz. In this case, the WIDE_XFACE input is set to 1'b0.

When WIDE_XFACE is set to 1'b1, each channel accepts 20-bit data and clock at a maximum rate of 170 MHz. This mode is meant to ease interface timing while maintaining the maximum HDMI bandwidth requirement.

When WIDE_XFACE is set to 1'b1, the TMDSCCLKSRC clock frequency is not reduced to half simply through the WIDE_XFACE control. The frequency can be reduced to half through the I²C interface, register 0x1E, cko_word_div_enb control bit. This control is independent from the WIDE_XFACE selection.

34.3.2.3 Power Sequence

The HDMI_PHY power sequence implementation controls the PLL/MPLL start of operation, resistor calibration, and clock alignment.

As shown in the figure below, during power-up, the Power Sequence finite state machine (FSM) advances through the PLL and MPLL power-up states by loading a counter at the beginning of each state (pwr_cnt) and advancing when the counter (pwr_cnt) decrements to 0. After the Resistor Calibration FSM is enabled in the RES_CAL state, the FSM waits for the assertion of rcal_adc_done before advancing. After the Clock Alignment FSM is enabled in the TX_CLK_ALIGN state, the Power Sequence FSM waits for the assertion of tx_ck_align_done before advancing to the TX_READY state. The TX_READY state asserts the TX_READY output signal, which indicates that the HDMI_PHY is ready to transmit the TMDS clock and data and that normal operation can begin.

If TX_PWRON is deasserted in the TX_READY state, the Power Sequence FSM moves to the DISABLE_TX state. The power-down sequence is initiated. This state disables the TMDS clock and data outputs. Next, the PWR_DN_PLL resets the PLL and MPLL blocks. Finally, the FSM returns to the PWR_DN state and waits for TX_PWRON assertion to begin the power-up sequence.

The HDMI_PHY enters Power-down mode only when the TX_READY output is deasserted. To enable the power sequence to reach this state, when TX_PWRON is set to 1'b0 while the HDMI_PHY is in the "TX_READY" state, the PCLK input must continue

Functional Description

toggling until TX_READY is deasserted. This sequence is required to enable the Power Sequence FSM to continue its execution and move from TX_READY to DISABLE_TX, later to PWR_DN_PLL, and finally to PWR_DN that corresponds to the power-down state.

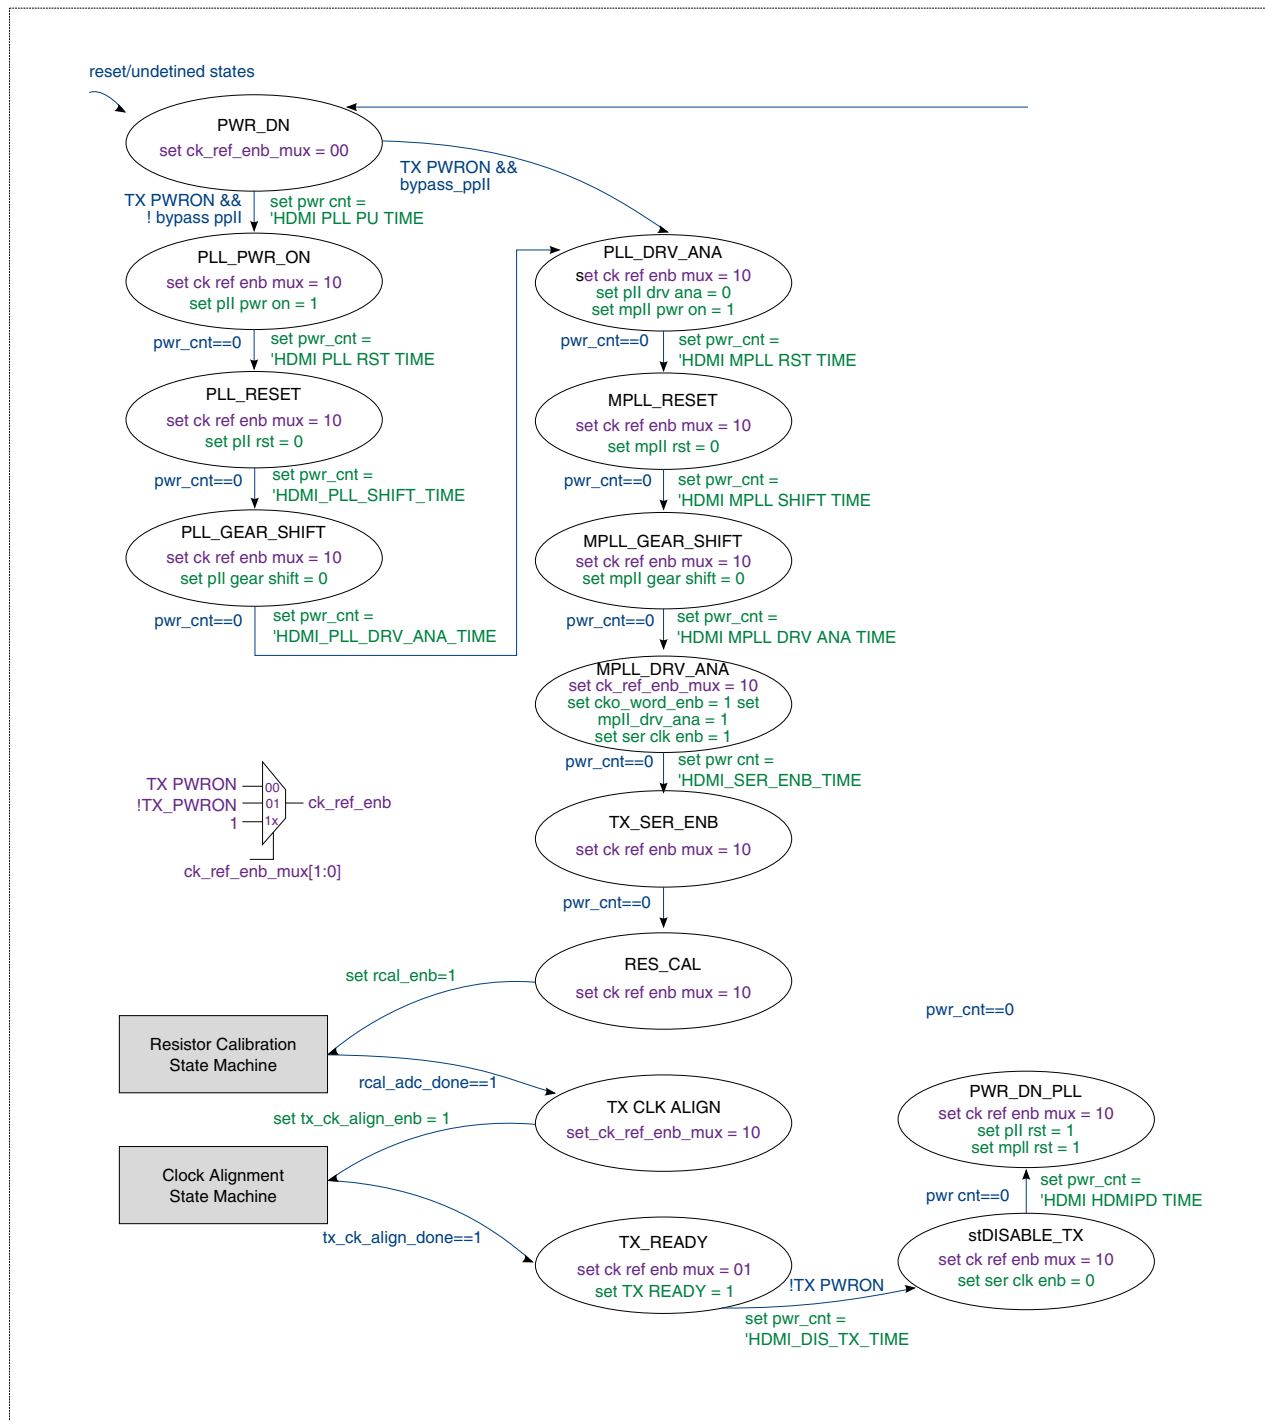

Figure 34-7. Power Sequence Finite State Machine

The following signals can be overridden through the control registers: `bypass_ppll`, `pll_pwr_on`, `pll_rst`, `pll_gear_shift`, `pll_drv_ana`, `mppll_rst`, `mppll_gear_shift`, `cko_word_enb`, `mppll_drv_ana`, `ser_ckl_enb`, `rcal_enb`, `tx_clk_align_enb`, `ser_clk_enb`, and `ck_ref_enb`.

The `rcal_adc_done` and `tx_ck_align_done` signals can be observed through the control registers or through the digital test bus (`dtb[1:0]`, controlled through control registers).

The `TX_PWRON` and `TX_READY` signals belong to the HDMI 3D Tx PHY macro interface.

The power sequence can also be started through control registers, using the `tx_pwron0`, `tx_pwron1`, `tx_pwron2`, and `ck_pwron` signals.

`TX_READY` can also be overridden through control registers.

The clock source that clocks the Power Sequence FSM is controlled by the `refclk_enb` signal. This signal is asserted when `TX_PWRON` is asserted or when the state machine is in a state other than `PWR_DN`. This signal can be overridden through the control registers.

NOTE

Due to a potential different state on some analog nodes, it is recommended that the power-up sequence be run twice (after the first `TX_READY` assertion, the PHY can be powered down, then powered up again).

The clock alignment procedure can be done differently for each of the power-up sequence runs. For the first run, the clock alignment can be set to be performed channel-by-channel (`tx_ck_align_mode = 1'b1`, register `0x1C`); for the second power-up, the clock alignment can be set to be performed for all channels at the same time (`tx_ck_align_mode = 1'b0`, register `0x1C`) to ensure inter-pair skew close to 0 UI.

34.3.2.3.1 PLL/MPLL

During power-up, the PLL block and (optionally) MPLL block receive the `pwrn`, `rst`, `gear_shift`, and `drv_ana` signals, as shown in the figure below. The minimum and maximum timing for these signals is listed in the table below. The power sequence then initiates the resistor calibration and clock alignment steps.

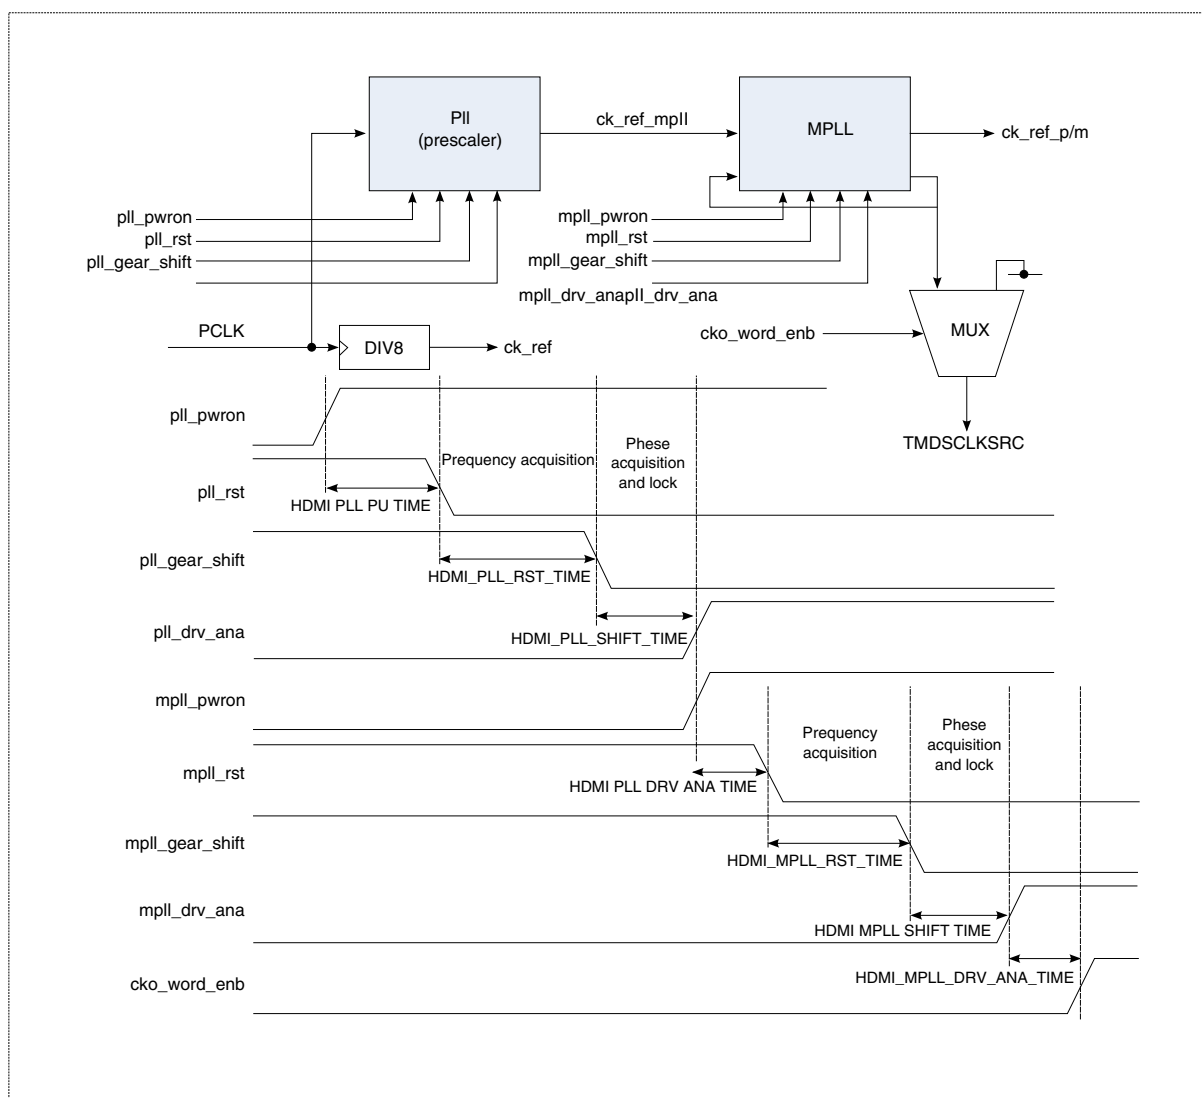

Figure 34-8. PLL/MPLL Power-Up Sequence

The following signals can be overridden through the control registers: `pll_pwron`, `pll_rst`, `pll_gear_shift`, `pll_drv_ana`, `mpll_pwron`, `mpll_rst`, `mpll_gear_shift`, `mpll_drv_ana`, and `cko_word_enb`.

`ck_ref`, `ck_ref_p/m`, and `ck_ref_mpll` are internal signals, while `PCLK` and `TMDSCCLKSRC` belong to the HDMI 3D Tx PHY macro interface.

The table below provides the PLL/MPLL power-up times.

Table 34-5. PLL/MPLL Power-Up Time

| Count Name | Count Value | Minimum Time (μ s) (T(refclk) = 0.00294 μ s) | Maximum Time (μ s) (T(refclk = 0.07407 μ s) |
|---|-------------|--|---|
| HDMI_PLL_PU_TIME | 125 | 2.294 | 74.074 |
| HDMI_PLL_RST_TIME | 1250 | 22.940 | 740.740 |
| HDMI_PLL_SHIFT_TIME | 50 | 0.918 | 29.630 |
| HDMI_PLL_DRV_ANA_TIME | 125 | 2.294 | 74.074 |
| HDMI_MPLL_RST_TIME | 2500 | 45.880 | 1481.480 |
| HDMI_MPLL_SHIFT_TIME | 1000 | 18.352 | 592.592 |
| HDMI_MPLL_DRV_ANA_TIME | 50 | 0.918 | 29.630 |
| HDMI_SER_ENB_TIME | 50 | 0.918 | 29.630 |
| Total PLL and MPLL Power-up Time | | 94.513 | 3,051.849 |

34.3.2.3.2 Resistor, ADC Calibration

Users can set the single-ended source termination resistance via the d_tx_term[2:0] control register bits, according to the table below.

Table 34-6. Single-Ended Source Termination Resistance Settings

| N | d_tx_term[2:0] | R(Ω) |
|---|----------------|---------------|
| 0 | 000 | 50 |
| 1 | 001 | 56.14 |
| 2 | 010 | 66.67 |
| 3 | 011 | 80 |
| 4 | 100 | 100 |
| 5 | 101 | 133.33 |
| 6 | 110 | 200 |
| 7 | 111 | Open |

To accurately set the specified termination, the resistor calibration measures the actual resistance of the external resistor. The resistance is measured using successive approximations of a 7-bit termination value by enabling each bit (one-hot) from MSB to LSB.

Users select the termination value by setting the d_tx_term[2:0] control register bits. The HDMI 3D Tx PHY includes differential source termination on the drivers.

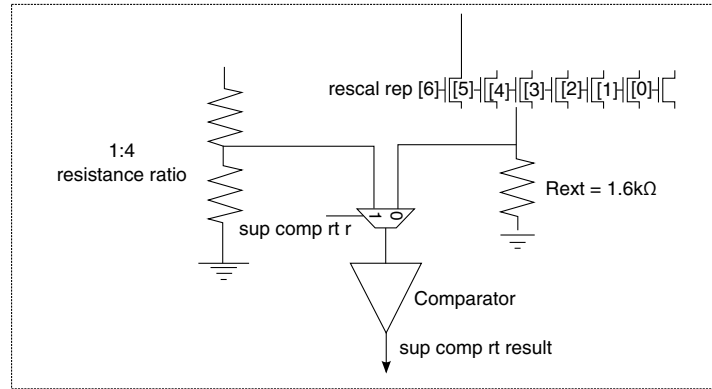

Figure 34-9. External Resistor Measurement

The exact value of R_{ext} is determined to create an exact termination.

The analog support block applies a current to the external resistor and compares the resultant voltage. The result (`sup_comp_rt_result`) is registered by the Calibration block.

The source termination is then set according to the following equation:

$$tx_rescal = rescal_rep \times (1 - 0.125 \times N)$$

Instead of subtracting by $(1/8th \times rescal_rep \times N)$, `rescal_rep` is initially multiplied by 8 (left shift by 3 bits), then `tx_rescal` is subtracted N number of times. N sets `clk_cnt`, which sets the number of subtraction loops, as shown in the table below. This table represents the `clk_cnt` required to trigger `tx_rescal_done`. The final result is divided by 8 (right shift by 3 bits) and rounded up if necessary.

Table 34-7. `clk_cnt` Necessary to Trigger `tx_rescal_done`

| N/d_tx_term | clk_cnt to Trigger tx_rescal_done |
|-------------|-----------------------------------|
| 0 | <all> |
| 1 | 0 |
| 2 | 1 |
| 3 | 2 |
| 4 | 3 |
| 5 | 4 |
| 6 | 5 |
| 7 | <all> |

The figure below shows the FSM for the resistor and ADC calibration.

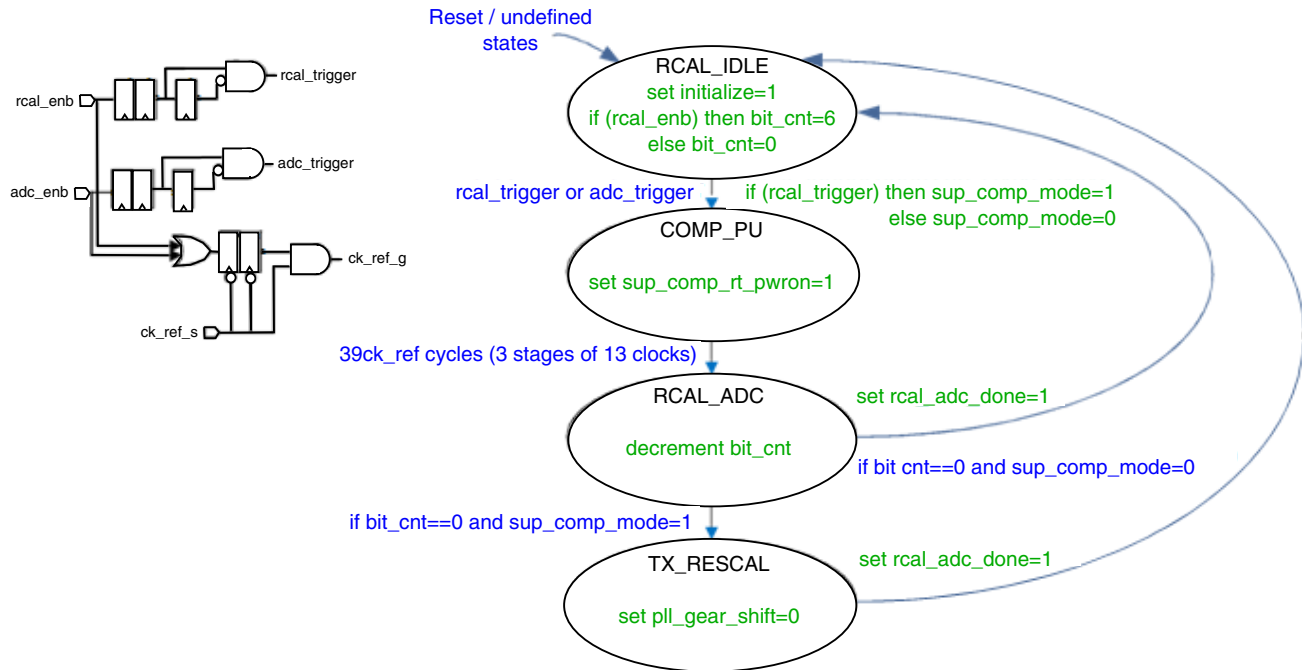

Figure 34-10. Finite State Machine for the Resistor and ADC Calibration

The rcal_enb signal is asserted by the Power Sequence FSM, but this signal can be overridden through the control registers.

The rescalf_rep, sup_comp_mode, sup_comp_rt_r, sup_comp_rt_result, tx_rescale, sup_comp_rt_pwron, and adc_enb signals can be overridden through the control registers.

The rcal_adc_done signal can be observed through the control registers or through the digital test bus (dtb[1:0], controlled through control registers).

34.3.2.3.3 Clock Alignment

There are two clocks in the transmit clock path, TMDSCCLKIN (from the parallel HDMI controller interface), and internal ck_tx_out (a divided-down clock, generated from the MPLL clock). These two clocks must be properly synchronized, aligning them before transmitting data through the HDMI 3D Tx PHY.

The alignment results in the internal tx_ser_clk (buffered version of TMDSCCLKIN) being delayed in the range of 0.6-0.8 UI with respect to the TMDSCCLKIN clock.

The Clock Alignment module adjusts the alignment between TMDSCCLKIN and tx_ser_clk by generating internal clock kill signals called tx_ser_clk_kill[2:0]. On the rising edge of each tx_ser_clk_kill[2:0] signal, the corresponding tx_ser_clk[2:0] is delayed by 0.2 UI.

The clock alignment enable input, tx_ck_align_enb, is generated by the power sequence, but this input can also be overridden through the control registers.

Because it is assumed that channel 1 (the middle channel) has the median delays among the three channels, the state machine will compare TMDSCCLKIN and tx_ser_clk[1] only when the register bit, tx_ck_align_mode, is low (default). In this case, tx_ser_clk_kill[2:0] is asserted simultaneously. When tx_ck_align_mode is high, each channel is aligned individually. Channel 2 is aligned first, followed by channel 0 and lastly channel 1. The tx_ck_align_mode signal is controlled through the control registers.

The internal clock kill signals, tx_ser_clk_kill2, tx_ser_clk_kill1, and tx_ser_clk_kill0, are generated by the Clock Alignment state machine, but these signals can be overridden through the control registers.

34.3.2.4 Color Depth and Color Mode Selection

This section describes HDMI 3D Tx PHY color depth and color mode selection.

34.3.2.4.1 Pixel Repetition Clock Generation Selection

For small displays operating a TMDS clock below 25 MHz or applications that require an increase in available bandwidth for audio and auxiliary information transmission, the HDMI_PHY can generate pixel repetition clocks.

Pixel repetition signals are dedicated to configure pixel repetition rates. These signals affect only the relation between PCLK and PREPCLK.

$PCLK \ 1 / (\text{pixel repetition}) \times PREPCLK$

34.3.3 Configuration and Test Mode

This section describes HDMI 3D Tx PHY configuration and test mode operation.

The HDMI 3D Tx PHY can be configured and set in test mode through the supported I²C interface.

To avoid transient periods in the macro operation during reconfiguration procedures, it is highly recommended that the I²C interface be used while the HDMI 3D Tx PHY is in Power-down mode.

[Control Registers](#) describes all the registers and corresponding fields that are available through the I²C interface.

34.3.3.1 Power-Up Configuration

Before powering up the HDMI 3D Tx PHY, configure the PHY for proper operation and performance.

Configuring the PHY through the I²C interface is as follows.

NOTE

The recommended settings for the PLL/MPLL mode of operation and driver configurations provided in this section are presented as the default value that should be considered and initially configured. Unless stated otherwise, these recommended settings apply to all operating frequencies.

PLL/MPLL Mode of Operation

Configuration summary: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode. For more information about these modes of operation, see [Power-Up Requirements](#).

Table 34-8. PLL/MPLL Mode of Operation

| Fields | Bits | Default |
|---------------------|------|---------|
| Register0x13 | | |
| bypass_pll | 11 | 1'b0 |
| Register0x17 | | |
| cko_sel | 2-1 | 2'b11 |

PLL/MPLL Clock Dividers and Analog Configuration

Configuration summary: Configured for each video mode. For information about the PLL and MPLL divider settings, see Table B-2 .

Table 34-9. PLL/MPLL Clock Dividers and Analog Configuration

| Fields | Bits |
|----------------------|-------|
| Register 0x06 | |
| prep_div[1:0] | 14-13 |
| mpll_n_ctrl[1:0] | 8-7 |
| pll_n_ctrl[1:0] | 6-5 |
| pixel_rep[2:0] | 4-2 |
| clr_dpth[1:0] | 1-0 |

Table continues on the next page...

**Table 34-9. PLL/MPLL Clock Dividers and Analog Configuration
(continued)**

| Fields | Bits |
|-----------------------|------|
| Register 0x10 | |
| mppll_prop_cntrl[2:0] | 11-9 |
| mppll_int_cntrl[2:0] | 8-6 |
| pll_prop_cntrl[2:0] | 5-3 |
| pll_int_cntrl[2:0] | 2-0 |
| Register 0x15 | |
| pll_gmp_cntrl[1:0] | 3-2 |
| mppll_gmp_cntrl[1:0] | 1-0 |

Driver Edge Rate Control

Configuration summary: This bus controls the slew rate of the clock and data output drivers.

Table 34-10. Driver Edge Rate Control

| Fields | Bits | Default |
|----------------------|-------|---------|
| Register 0x06 | | |
| tx_edgerate[1:0] | 12-11 | 2'b00 |
| ck_edgerate[1:0] | 10-9 | 2'b00 |

Driver Single-Ended Source Termination

Configuration summary: This bus controls the driver single-ended source termination.

Table 34-11. Driver Single-Ended Source Termination

| d-tx_term | R (ohm) |
|-----------|--------------|
| 000 | 50 |
| 001 | 56.14 |
| 010 | 66.67 |
| 011 | 80 |
| 100 | 100 |
| 101 | 133.33 |
| 110 | 200 |
| 111 | Open circuit |

Functional Description

| Fields | Bits | Default |
|----------------|------|---------|
| Register 0x19 | | |
| d_tx_term[2:0] | 2-0 | 3'b101 |

Driver Voltage Level

Configuration summary: For information about the driver voltage level settings, see [Appendix A: Driver Voltage Level Configuration](#). Driver voltage level configuration is dependent on driver differential source termination and driver pre-emphasis settings.

Table 34-13. Driver Voltage Level

| Fields | Bits | Default |
|----------------|------|---|
| Register 0x0E | | |
| sup_tx_lv[4:0] | 9-5 | 25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110 |
| sup_ck_lv[4:0] | 4-0 | 25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110 |

Driver Pre-Emphasis

Configuration summary: Enables trailer drivers to enable pre-emphasis operation. Pre-emphasis is achieved by reducing the drive level of a non-transition bit with respect to a transition bit. The following table summarizes the total output current configured with pre-emphasis (I is current of unit current source).

Table 34-14. Driver Pre-Emphasis

| Total Output Current | tx_symon | tx_traon | tx_trbon |
|------------------------|----------|----------|----------|
| 0 * I | 0 | 0 | 0 |
| 36 * I | 1 | 0 | 0 |
| 36 * I + 3 * I | 1 | 0 | 1 |
| 36 * I + 6 * I | 1 | 1 | 0 |
| 36 * I + 6 * I + 3 * I | 1 | 1 | 1 |

The amount of pre-emphasis is programmed through the tx_traon and tx_trbon signals in the control register, address 0x09 as follows.

| Field | Bit | Default |
|-------|-----|---------|
|-------|-----|---------|

Table continues on the next page...

| | | |
|----------|---|--|
| tx_trbon | 1 | 25-148.5 MHz: 1'b0 222.75-340 MHz: 1'b1 |
| tx_traon | 2 | 1'b0 |

34.4 System-Level Implementation

34.4.1 System Operation

This section describes HDMI 3D Tx PHY system operation including power-up/power-down and power- on reset.

34.4.1.1 Powering Up and Powering Down

To set the HDMI_PHY in Power-down mode, set the TX_PWRON signal to 1'b0 and the PDDQ signal to 1'b1. To power up the HDMI 3D Tx PHY and place it in Active mode, set TX_PWRON to 1'b1 and PDDQ to 1'b0.

Any configuration programmed on the HDMI_PHY must be done in Power-down mode. To configure the PHY through the I²C interface, set PHY_RESET to 1'b0 (to move the digital core from a reset state and to enable programming).

The figure below shows the power-down and power-up sequences.

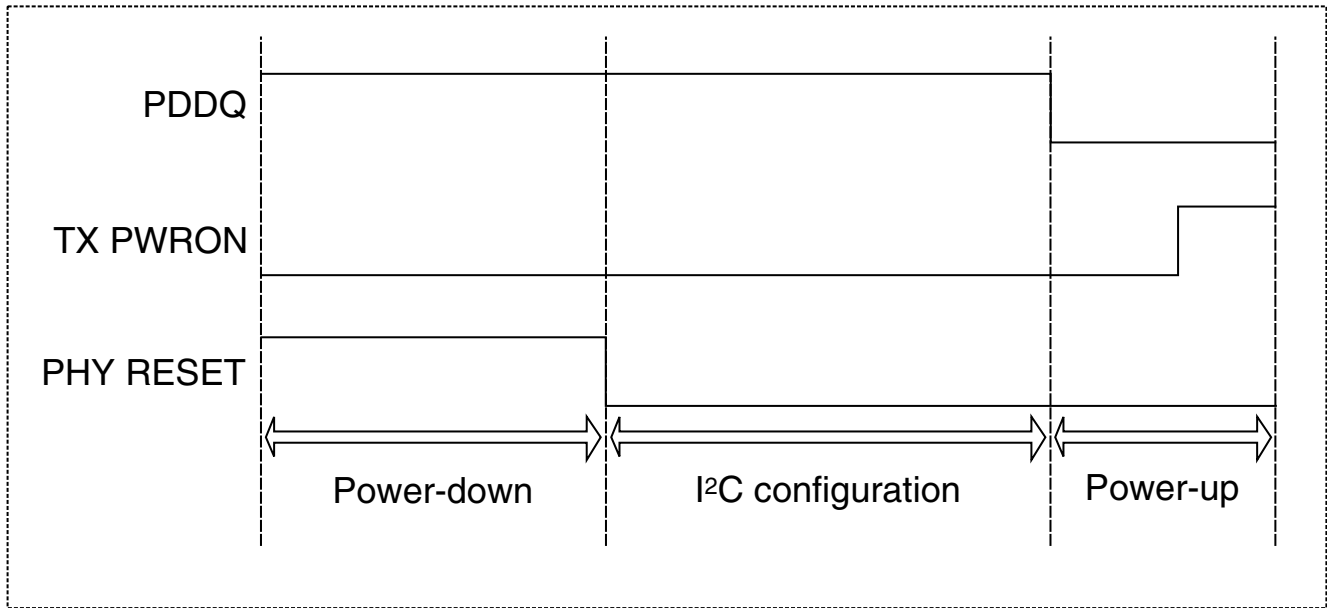

Figure 34-11. Power-Down and Power-Up Sequence

The power-up sequence starts by advancing one finite state machine (FSM) through the Phase-Locked Loop (PLL) and Multiplexed Phase-Locked Loop (MPLL) power-up states. Afterwards, resistor calibration is performed and clock alignment is enabled. When clock alignment is completed, the TX_READY signal is set to 1'b1 to indicate that the PHY is ready to transmit the TMDS clock and that data transmission and normal operation can start.

In Power-down mode, TMDS clock and data lines are disabled.

Power-Up Configuration

Before powering up the HDMI_PHY, configure the PHY for proper operation and performance. The following PHY characteristics can be configured:

- PLL/MPLL mode of operation: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode.
- PLL/MPLL clock dividers and analog configuration: Configure for each video mode.
- Driver edge rate control: Slew rate of clock and data output drivers
- Driver differential source termination: Differential source termination of clock and data output drivers
- Driver voltage level: Voltage reference level for clock and data channels
- Driver pre-emphasis: Enable and control pre-emphasis operation

For more information about this configuration and the associated control registers and signals, see [Power-Up Configuration](#).

34.4.1.2 Active Mode Requirements

During normal operation, the RXSENSE circuitry must always be enabled (ENHPDRXSENSE asserted high).

During normal operation, if ENHPDRXSENSE is deactivated (asserted low), the PHY's analog portion is turned off.

34.4.1.3 Power-Up Requirements

Before setting the TX_PWRON signal high and the PDDQ signal low to power up the HDMI 3D Tx PHY, the PCLK and TMDSCCLKIN input reference clocks must be stable and within their specified parameters, and power supply rails must be stable and within the specifications.

34.4.1.4 Power Supply Sequence When the HDMI 3D Tx PHY is Not Used

The HDMI 3D Tx PHY supports power collapsing.

There is no constraint on the power supply sequence when the HDMI 3D Tx PHY is not used. However, it is recommended that you short the data/clock lines to ground (or leave them floating). Activity at the data/clock lines or shorting the data/clock lines to the 3v3 rail (from Rx) should be avoided.

34.4.1.5 Power-Down Requirements

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). This sequence is required to enable the power-sequence machine to continue its execution and move from its states until the machine reaches the power-down state.

If this sequence is not followed, TX_READY is not set to 1'b0, and the HDMI 3D Tx PHY remains in Active mode.

34.5 Reference Clock

This chapter describes the reference clock that the HDMI_PHY supports.

The HDMI_PHY system requires an input clock signal that must be applied to the PCLK input with the following constraints:

- Minimum PCLK period/frequency (pixel repetition): 74 ns/13.5 MHz
- Minimum PCLK period/frequency (no pixel repetition): 39.7 ns/24.175 MHz
- PCLK duty cycle: 40-60%
- Maximum PCLK long-term RMS jitter: 100 ps

34.6 Control Registers

34.6.1 Control Registers Module Design Architecture

The Control Registers module is designed to provide the HDMI 3D Tx PHY with a file register component (36 words where each word comprises 16 bits).

Each register is designed to correspond to one of the following access types.

- **Read-only:** The HDMI controller can only read from this register. No writing by the HDMI controller is permitted.
- **Read/write:** The HDMI controller can read from and write to this register.
- **Read/write/override:** The HDMI controller can read from and write to this register. However, if the MSB of the register is set to 0, the value read by the HDMI controller will not be the value stored in the register; instead, the value will be the internal value of the HDMI PHY. In particular, this event occurs for 0x14, 0x18, 0x0A, and 0x0F where the value is read from the I²C interface when PHY_RESET and TX_PWRON are low.
- **Read/write/asynchronous set-on-done:** The HDMI controller can read from and write to this register synchronously. However, three internal modules (Resistance Calibration, Clock Alignment, and Tx Scope) can write to this register asynchronously.

34.7 HDMI_PHY Memory Map/Register Definition

NOTE

HDMI_PHY registers are accessed through the I2C Master Interface of the HDMI Controller. See [HDMI Transmitter \(HDMI\)](#) for more information.

HDMI_PHY memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |

34.7.8 Tx and Clock Measure Control (HDMI_PHY_TXCLKMEASCTRL)

Register name: TXCKMEASCTRL

Access type: Read/write

Address: 0x07

Value at reset: 0x0000

Table 34-25. tx_meas_iv2[7:0]

| Effective Bit | Register Value | Description |
|----------------|----------------|---|
| tx_meas_iv2[0] | 00000001 | Connect V_{cm_p} (common DC voltage of the positive side of scope) to the analog test bus. |
| tx_meas_iv2[1] | 00000010 | Connect V_{cm_m} (common DC voltage of the negative side of scope) to the analog test bus. |
| tx_meas_iv2[2] | 00000100 | Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus. |
| tx_meas_iv2[3] | 00001000 | Connect t_{x_vref} (reference voltage of tx_biasgen block) to the analog test bus. |
| tx_meas_iv2[4] | 00010000 | Connect V_{rep_fb} (feedback voltage of the replica circuit of tx_biasgen block) to the analog test bus. |
| tx_meas_iv2[5] | 00100000 | In the event that bleed current is too large, this bit can be used to force vb closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull vb to gnd properly.) |
| tx_meas_iv2[6] | 01000000 | Connect V_p (low power supply) to the analog test bus. |
| tx_meas_iv2[7] | 10000000 | Connect V_{cm} (common DC voltage of the scope) to the analog test bus. |

Table 34-26. ck_meas_iv[7:0]

| Effective Bit | Register Value | Description |
|---------------|----------------|---|
| ck_meas_iv[0] | 00000001 | Connect V_{cm_p} (common DC voltage of the positive side of scope) to the analog test bus. |
| ck_meas_iv[1] | 00000010 | Connect V_{cm_m} (common DC voltage of the negative side of scope) to the analog test bus. |
| ck_meas_iv[2] | 00000100 | Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus. |

Table continues on the next page...

Table 34-26. ck_meas_iv[7:0] (continued)

|--------------------------|--|
| 15 Override | If the Override bit is set to 1, the working value is the Override bit value, not the registered value. |
| 14–11 - | This field is reserved. Reserved |
| 10–3 sup_dac_n[7:0] | Support Analog-to-Digital Inverted This bus represents the LSB's of the 9-bit DAC value. |
| 2–0 sup_dac_th_n[2:0] | Support Digital-to-Analog Thermometer Inverted This bus value is inverted and defined in the thermometer code to represent the binary code of the two MSB's of the 9-bit DAC value. Note: To increase the stability of the DAC block, the two MSB's of the 9-bit DAC value are represented in thermometer code, not in binary code. The MSB's of the 9-bit DAC value is split into two thermometer-code bits. A transition from 0 to 1 of the 9-bit DAC value's MSB is represented by "00" -> "01" -> "11" in thermometer code. |

34.7.17 Current Control (HDMI_PHY_CURRCTRL)

Register name: CURRCTRL

Access type: Read/write

Address: 0x10

| 15 Override | If the Override bit is set to 1, the working value is the Override bit value, not the registered value. |
| 14–2 - | This field is reserved. Reserved |
| 1 pll_drv_ana | PLL Drive Analog This bit enables or disables driving the ck_ref_mppll_p/m clocks to the MPLL module. Default (reset) value of pll_drv_ana is 1. 0 Set ck_ref_mppll low, if the Override bit is 0. 1 Enable 25-340 MHz output clock (ck_ref_mppll_p/m) to be driven to MPLL, if the Override bit is 0. |
| 0 mpll_drv_ana | MPLL Drive Analog This bit enables or disables driving the ck_ref_p/m clocks to all transmitters (tx_topa). Default (reset) value of mpll_drv_ana is 1. 0 Set ck_ref_p high; ck_ref_m low, if the Override bit is 0. 1 Enable ck_ref_mppll output clock (125-1700 MHz ck_ref_p/m) to be driven to all transmitters (tx_topa), if the Override bit is 0. |

34.7.19 PLL Measure Control (HDMI_PHY_PLLMEASCTRL)**Register name:** PLLMEASCTRL**Access type:** Read/write**Address:** 0x12**Value at reset:** 0x0000**NOTE**

With the exception of pll_atb_sense_sel and pll_meas_iv[9], two or more of the previous register bits must not be set to 1 simultaneously; doing so can lead to a hardware problem.

The table below describes the pll_meas_iv[10:0] bit settings.

Table 34-40. pll_meas_iv[10:0]

| Effective Bit | Pll_meas_iv[10:0] Value | Description |
|----------------|-------------------------|--|
| Pll_meas_iv[0] | 00000000001 | Not used. |
| Pll_meas_iv[1] | 00000000010 | Not used in pll_top. Connected to fast_tech pins of PLL and MPLL in hdmi_topa. |

Table continues on the next page...

Table 34-40. pll_meas_iv[10:0] (continued)

| | | |
|-----------------|-------------|---|
| Pll_meas_iv[2] | 00000000100 | Connects VP supply voltage to the atb_sense line. |
| Pll_meas_iv[3] | 00000001000 | Connects vp_cp to the atb_sense line. |
| Pll_meas_iv[4] | 00000010000 | Connects internal supply voltage of the VCO (ivco) to the atb_sense line. |
| Pll_meas_iv[5] | 00000100000 | Connects vp_cko voltage to the atb_sense line. |
| Pll_meas_iv[6] | 00001000000 | Connects node vpsf to the atb_sense line. |
| Pll_meas_iv[7] | 00010000000 | Connects vref to atb_sense line. |
| Pll_meas_iv[8] | 00100000000 | Connects vcntnl to atb_sense line. |
| Pll_meas_iv[9] | 01000000000 | Enables the phase mixer and pll_cko_pm_p/m. |
| Pll_meas_iv[10] | 10000000000 | Measures the voltage corresponding to the output phase of the clr_dpth divider (fb_clk) with respect to refclk. |

34.7.23 MPLL Measure Control (HDMI_PHY_MPLLMEASCTRL)

Register name: MPLLMEASCTRL

Access type: Read/write

Address: 0x16

Value at reset: 0x0000

NOTE

With the exception of `mpll_atb_sense_sel`, `mpll_meas_iv[9]`, and `mpll_meas_iv[11]`, two or more of the previous register bits must not be set to 1 simultaneously, because doing so can lead to a hardware problem.

The table below describes the `mpll_meas_iv[11:0]` bit settings.

Table 34-45. mpll_meas_iv[11:0]

| Effective Bit | mpll_meas_iv[11:0] Value | Description |
|-------------------------------|-----------------------------|--|
| <code>mpll_meas_iv[0]</code> | 000000000001 | Connects the internal positive DCC control line (<code>vc0p</code>) to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[1]</code> | 000000000010 | Connects the internal negative DCC control line (<code>vc0m</code>) to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[2]</code> | 000000000100 | Connects VP supply voltage to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[3]</code> | 000000001000 | Connects <code>vp_cp</code> to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[4]</code> | 000000010000 | Connects the internal supply voltage of the VCO (<code>ivco</code>) to the <code>atb_sense</code> line through a low-pass filter. |
| <code>mpll_meas_iv[5]</code> | 000000100000 | Connects the <code>vp_cko</code> voltage to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[6]</code> | 000001000000 | Connects the <code>vpsf</code> node to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[7]</code> | 000010000000 | Connects <code>vref</code> to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[8]</code> | 000100000000 | Connects <code>vcntrl</code> to the <code>atb_sense</code> line. |
| <code>mpll_meas_iv[9]</code> | 001000000000 | Enables the phase mixer and <code>cko_pm_p/m</code> . |
| <code>mpll_meas_iv[10]</code> | 010000000000 | Measures the voltage corresponding to the phase of the divide-by-5 output (<code>fb_clk</code>) with respect to the phase of the <code>mpll_ana</code> input (<code>ck_refclk_p</code>). |
| <code>mpll_meas_iv[11]</code> | 100000000000 | Forces <code>div_x1</code> low; therefore, <code>bitclk_p/m</code> is multiplexed to <code>ck_ref_p/m</code> (normally, if <code>n_cntrl</code> = 00, <code>ck0_p/m</code> is multiplexed to <code>ck_ref_p/m</code> and DCC loop is enabled). |

34.8 Appendix A: Driver Voltage Level Configuration

This appendix describes the driver voltage level configuration.

This configuration depends on the source termination value, the driver pre-emphasis settings, and the target signal voltage level swing.

A correct configuration must be set to meet both eye diagram mask and the specified high and low signal voltage levels.

To correctly configure the driver voltage level, the following parameters and signals (represented through their symbol) must be taken into consideration:

- $VPH_{RXTERM} = 3.3\text{ V} \rightarrow 3.3\text{-V}$ supply rail connected to HDMI PHY sink termination resistors
- $RXTERM = 50\ \Omega \rightarrow$ HDMI PHY sink termination resistors

| Control Register | Signal | Symbol |
|------------------|-----------------|--------|
| 0x19 | d_tx_temp[2:0] | RTERM |
| 0x0E | sup_tx_lv[4.:0] | TXLVL |
| 0x0E | sup_ck_lv[4.:0] | CKLVL |
| 0x09 | tx_symon | SYMON |
| 0x09 | tx_traon | TRAON |
| 0x09 | tx_trbon | TRBON |

The following table defines the pre-emphasis factor (PREEMPH) to be used in the information that follows.

| SYMON | TRAON | TRBON | PREEMPH |
|-------|-------|-------|---------|
| 0 | 0 | 0 | - |
| 1 | 0 | 0 | 0.00 |
| 1 | 0 | 1 | 0.08 |
| 1 | 1 | 0 | 0.17 |
| 1 | 1 | 1 | 0.25 |

The following equations can be used to calculate-for a certain signal voltage swing (VSWING) and PHY configuration (PREEMPH, RTERM)-the signal's high and low voltage levels (VHI, VLO).

$$VHI = VLO + VSWING$$

$$TXLVL = CKLVL = [0.772 - (VPH_{RXTERM} - VLO)] / 0.01405$$

For a certain termination value and pre-emphasis configuration (factor), users input only the VSWING value. With this data, users can obtain the respective VHI and VLO DC levels and the TXLVL and CKLVL configuration to apply to the PHY.

Lower TXLVL/CKLVL values result in higher signal amplitudes, while higher TXLVL/CKLVL values result in lower signal amplitudes.

Values for VSWING, VHI, and VLO must be within HDMI 1.4a specification limits. The table below provides driver voltage level settings for some example scenarios.

Table 34-65. Example Driver Voltage Level Settings

| RTERM | SYMON | TRAON | TRBON | VHI (V) | VLO (V) | VSWING (V) | TXLVL | TXLVL (BIN) | CKLVL | CKLVL (BIN) |

34.9 Appendix B

This appendix describes the PLL/MPLL configurations that must be made for each video mode of operation.

The PLL/MPLL configurations are divided in two distinct sections. [Power-Up Requirements](#) describes how to configure the PLL/MPLL mode of operation, and [PLL/MPLL Generic Configuration Settings](#) describes all the settings required to configure the PLL/MPLL for each specific video mode.

34.9.1 Single or Two-PLL in Coherent or Non-Coherent Mode of Operation

Table 34-66. Single or Two-PLL in Coherent or Non-Coherent Mode of Operation

| Mode of Operation | bypass_ppll Register address: 0013: Bit 11 | cko_sel<1> Register address: 0017: Bit 2 | cko_sel<0> Register address: 0017: Bit 1 |
|--------------------------------|--|--|--|
| Two-PLL Non-Coherent (default) | 0 | 0 | 0 |
| Two-PLL Coherent | 0 | 1 | 1 |
| Single-PLL Non-Coherent | 1 | 1 | 0 |
| Single-PLL Coherent | 1 | 1 | 1 |

NOTE

Single-PLL Coherent and Non-Coherent modes can be set for only video formats with no pixel repetition and color depth equal to 8 bits.

34.9.2 PLL/MPLL Generic Configuration Settings

Each supported video format can be referred to by its input pixel clock frequency, pixel repetition, and color depth in bits.

The table below provides all the PLL/MPLL settings necessary to completely configure the blocks for any supported video format.

Table B-2 PLL/MPLL Generic Configuration Settings

34.10 Appendix C: 3D Video Formats

3D video formats are created from any of the supported VICs. The 3D structure in which the frames are organized determines the way data is transferred.

The 3D video format is indicated using the VIC in the AVI InfoFrame (indicating one of the 2D formats defined in the CEA-861-D standard) in conjunction with the 3D_Structure field in the HDMI vendor-specific InfoFrame.

For Side-by-Side (Half) and Top-and-Bottom 3D structures, pixel clock frequency is equal to the original VIC pixel clock frequency.

For the L+depth+GFX+GFX-depth 3D structure, pixel clock frequency is equal to 4x the original VIC pixel clock frequency.

For other 3D structures, pixel clock frequency is equal to 2x the original VIC pixel clock frequency.

The following table summarizes the original 2D VIC pixel clock frequencies required to support the 3D structures.

Table 34-68. 2D VIC Pixel Clock Frequencies Required to Support 3D Structures

| 3D Structure | 2D Pixel Clock Frequency |
|------------------------------------|-----------------------------|
| 0000 (Frame Packing) | 2x 2D pixel clock frequency |
| 0001 (Field alternative) | 2x 2D pixel clock frequency |
| 0010 (Line alternative) | 2x 2D pixel clock frequency |
| 0011 (Side-by-Side (Full)) | 2x 2D pixel clock frequency |
| 0100 (L + depth) | 2x 2D pixel clock frequency |
| 0101 (L + depth + GPX + GFX-depth) | 4x 2D pixel clock frequency |
| 0110 (Top-and-Bottom) | 2D pixel clock frequency |
| 1000 (Side-by-Side (Half)) | 2D pixel clock frequency |

VIC-specific PLL/MPLL configurations apply to Side-by-Side (Half) and Top-and-Bottom 3D structures. To obtain the PLL/MPLL configuration for a specific VIC used within a 3D structure, see [PLL/MPLL Generic Configuration Settings](#). Each configuration corresponds to a specific video format's pixel clock, pixel repetition, and color depth combination.

Example:

VIC 32: No pixel repetition, PCLK = 74.25 MHz, CD = 8,10,12,16

VIC 32 within 3D structure:

- Side-by-Side (Half) 3D structure (same pixel clock frequency): Same PLL/MPLL configuration as for VIC 32.
- Frame Packing (doubled pixel clock frequency): PLL/MPLL configuration corresponds to a row in [Table 34-67](#) with the following: no pixel repetition, PCLK = 148.5 MHz, CD = 8,10,12,16.

For VICs where PCLK = 148.5 MHz, no color depth is supported for 3D video format, because the pixel clock frequency would be greater than 340 MHz.

[Table 34-69](#) provides examples of primary 3D video format timings, and [Table 34-70](#) provides examples of other 3D video format timings. Secondary 3D video format timings can be found in the HDMI specification.

Table 34-69. Primary 3D Video Format Timings

| VIC | Video | Vertical Refresh Rate (Hz) | 2D Pixel Clock (MHz) | 3D Structure | 3D Pixel Clock (MHz) |
|-----|--------------|----------------------------|----------------------|----------------------------|----------------------|
| 4 | 1,280x720p | 59.94/60 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 4 | 1,280x720p | 59.94/60 | 74.25 | 0110 (Top-and-Bottom) | 74.25 |
| 4 | 1,280x720p | 59.94/60 | 74.25 | 1000 (Side-by-Side (Half)) | 74.25 |

| 19 | 1,280x720p | 50 | 74.25 | 0110 (Top-and-Bottom) | 74.25 |
| 19 | 1,280x720p | 50 | 74.25 | 1000 (Side-by-Side (Half)) | 74.25 |
| 60 | 1,280x720p | 23.97/24 | 58.40 | 0000 (Frame Packing) | 118.8 |
| 62 | 1,280x720p | 29.97/30 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 5 | 1,920x1,080i | 59.94/60 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 5 | 1,920x1,080i | 59.94/60 | 74.25 | 1000 (Side-by-Side (Half)) | 74.25 |
| 20 | 1,920x1,080i | 50 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 20 | 1,920x1,080i | 50 | 74.25 | 1000 (Side-by-Side (Half)) | 74.25 |
| 32 | 1,920x1,080p | 23.98/24 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 32 | 1,920x1,080p | 23.98/24 | 74.25 | 0110 (Top-and-Bottom) | 74.25 |
| 32 | 1,920x1,080p | 23.98/24 | 74.25 | 1000 (Side-by-Side (Half)) | 74.25 |
| 34 | 1,920x1,080p | 29.98/30 | 74.25 | 0000 (Frame Packing) | 148.50 |
| 34 | 1,920x1,080p | 29.98/30 | 74.25 | 0110 (Top-and-Bottom) | 74.25 |
| 16 | 1,920x1,080p | 59.94/60 | 148.50 | 0110 (Top-and-Bottom) | 148.50 |
| 31 | 1,920x1,080p | 50 | 148.50 | 0110 (Top-and-Bottom) | 148.50 |

Table 34-70. Examples of Other 3D Video Formats

| VIC | Video | Vertical Refresh Rate (Hz) | 2D Pixel Clock (MHz) | 3D Structure | 3D Pixel Clock (MHz) |
|-----|--------------|----------------------------|----------------------|------------------------------------|----------------------|
| 5 | 1,920x1,080i | 59.94/60 | 74.25 | 0001 (Field alternative) | 148.5 |
| 20 | 1,920x1,080i | 50 | 74.25 | 0001 (Field alternative) | 148.5 |
| 16 | 1,920x1,080p | 59.94/60 | 148.50 | 0010 (Line alternative) | 297 |
| 31 | 1,920x1,080p | 50 | 148.50 | 0010 (Line alternative) | 297 |
| 16 | 1,920x1,080p | 59.94/60 | 148.50 | 0011 (Side-by-Side (Full)) | 297 |
| 31 | 1,920x1,080p | 50 | 148.50 | 0011 (Side-by-Side (Full)) | 297 |
| 19 | 1,280x720p | 50 | 74.25 | 0100 (L + depth) | 148.5 |
| 19 | 1,280x720p | 50 | 74.25 | 0101 (L + depth + GFX + GFX-depth) | 297 |

Chapter 35

I2C Controller (I2C)

35.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

Three independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

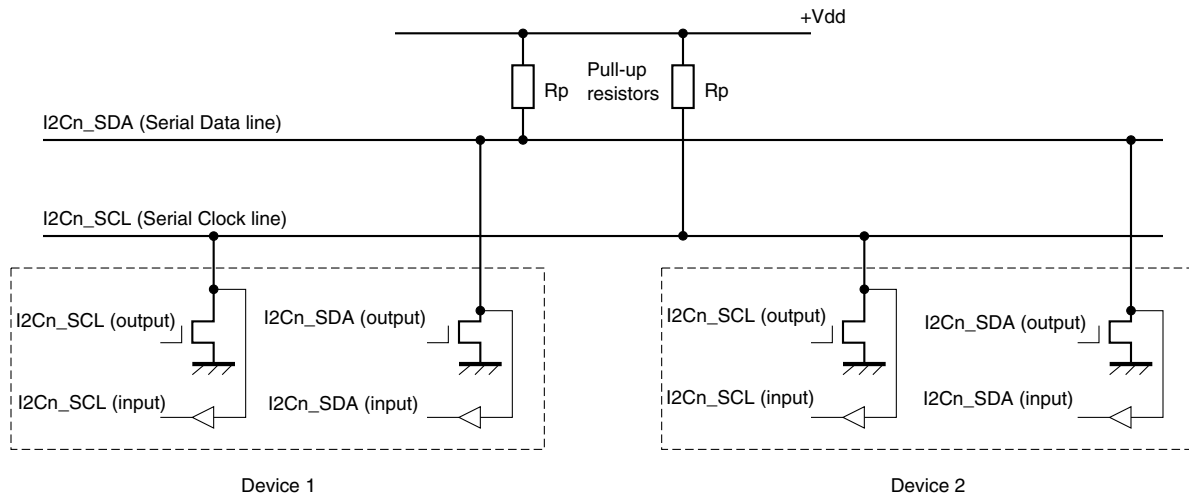

Figure 35-1. Connection of devices to I2C bus

The I2C interface operates at up to 400 kbps, but the speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

Figure 35-2. I2C block diagram

35.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

35.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

35.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 35-1. I2C External Signals

| Signal | Description | Pad | Mode | Direction |
|----------------|--------------|-----------|------|-----------|
| I2C1_SCL (SCL) | Serial Clock | CSI0_DAT9 | ALT4 | IO |
| | | EIM_D21 | ALT6 | |
| I2C1_SDA (SDA) | Serial Data | CSI0_DAT8 | ALT4 | IO |
| | | EIM_D28 | ALT1 | |
| I2C2_SCL (SCL) | Serial Clock | EIM_EB2 | ALT6 | IO |
| | | KEY_COL3 | ALT4 | |
| I2C2_SDA (SDA) | Serial Data | EIM_D16 | ALT6 | IO |
| | | KEY_ROW3 | ALT4 | |

Table continues on the next page...

Table 35-1. I2C External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|----------------|--------------|---------|------|-----------|
| I2C3_SCL (SCL) | Serial Clock | EIM_D17 | ALT6 | IO |
| | | GPIO_3 | ALT2 | |
| | | GPIO_5 | ALT6 | |
| I2C3_SDA (SDA) | Serial Data | EIM_D18 | ALT6 | IO |
| | | GPIO_6 | ALT2 | |
| | | GPIO_16 | ALT6 | |

35.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 35-2. I2C Clocks

| Clock name | Clock Root | Description |
|----------------|-----------------|-------------------------|
| ipg_clk_patref | perclk_clk_root | Module clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

- Peripheral clock (ipg_clk_s): This clock is used for peripheral bus register read/writes.
- Module clock (ipg_clk_patref): This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

35.4 Functional description

This section provides a complete functional description of the block.

35.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

35.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

35.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 35-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

Figure 35-3. Synchronized clock SCL

35.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

35.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

35.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

35.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

35.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

35.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

35.4.10 Byte order

The block only supports the Little-Endian mode.

35.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

35.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

35.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

35.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 35-5](#).

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

35.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

35.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

35.5.6 Slave mode

In the slave interrupt service routine (see [Figure 35-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

35.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in [Figure 35-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

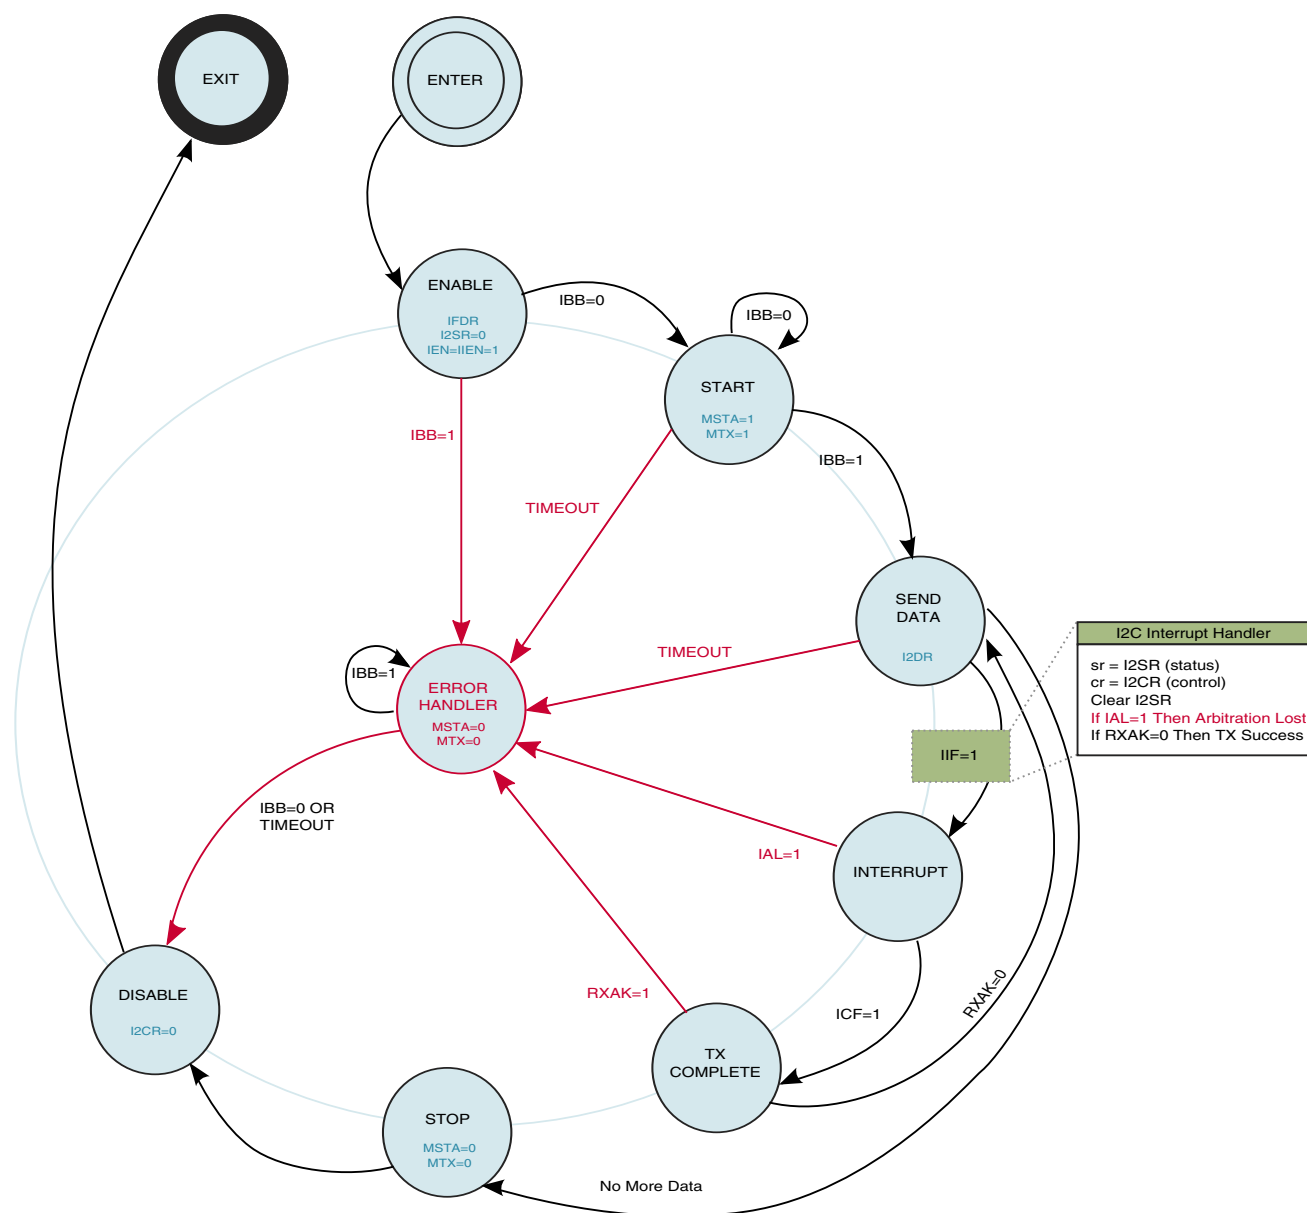

Figure 35-4. I2C Programming state diagram

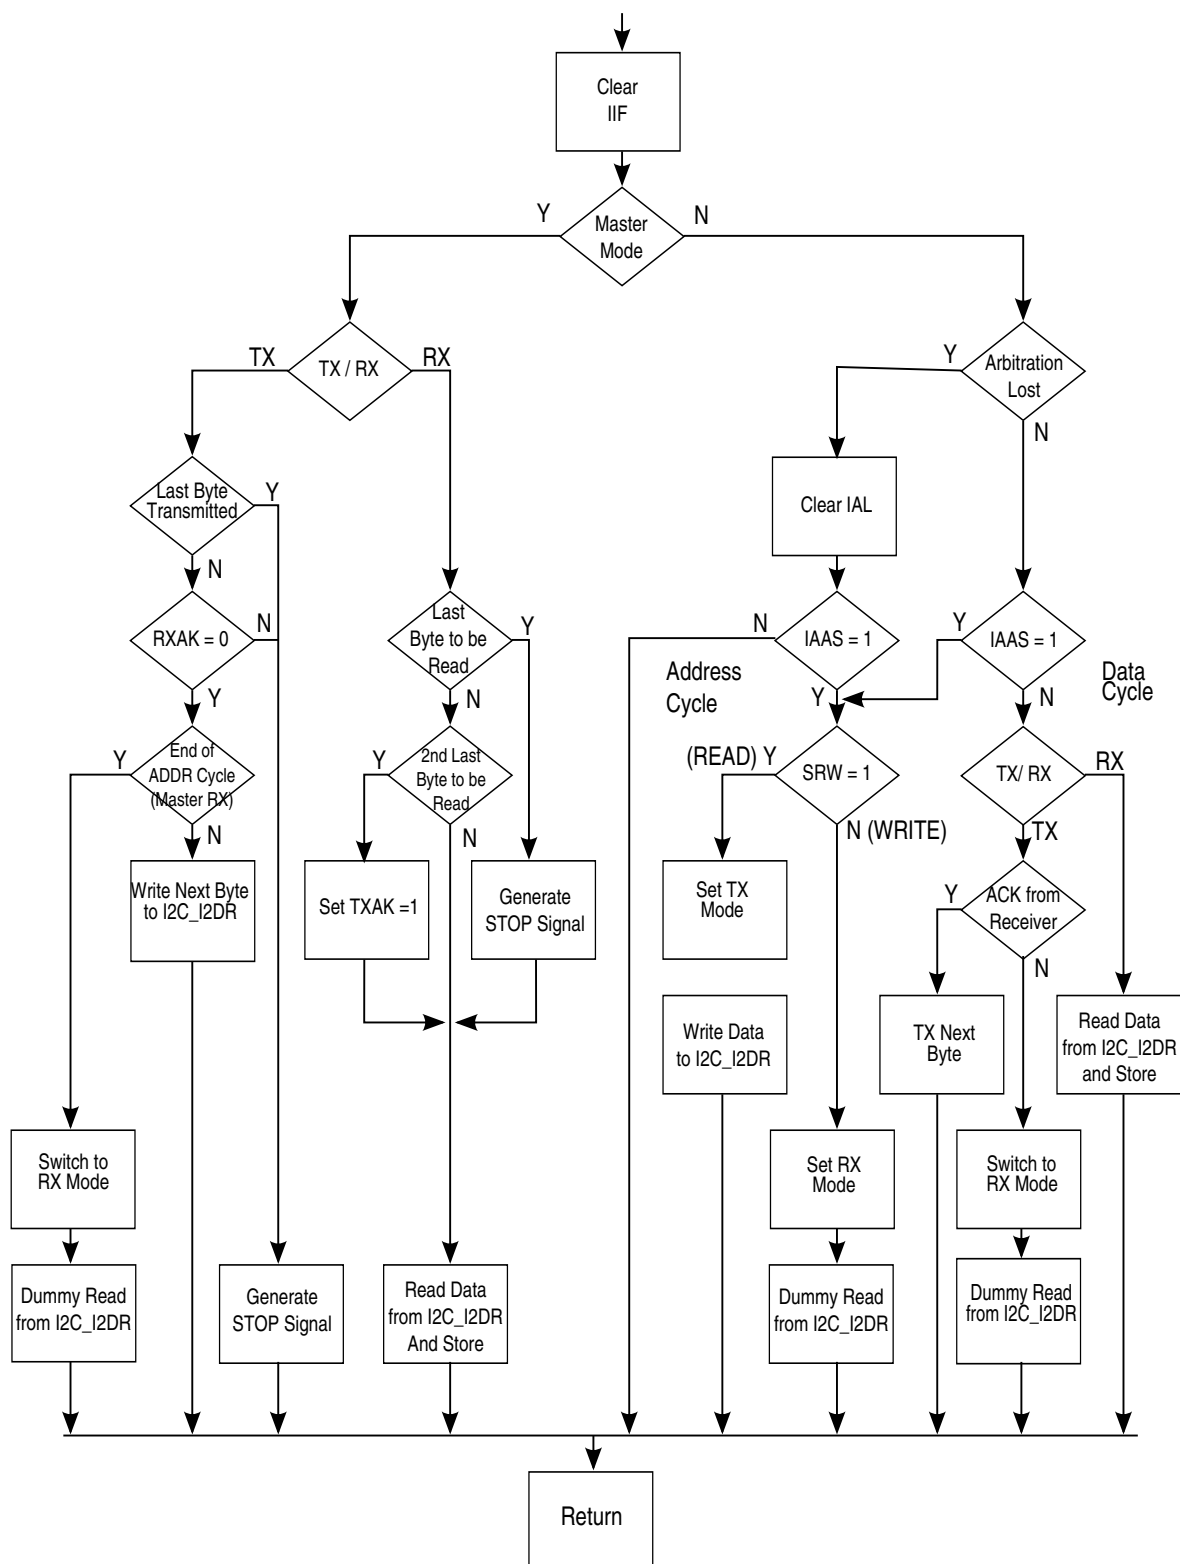

Figure 35-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

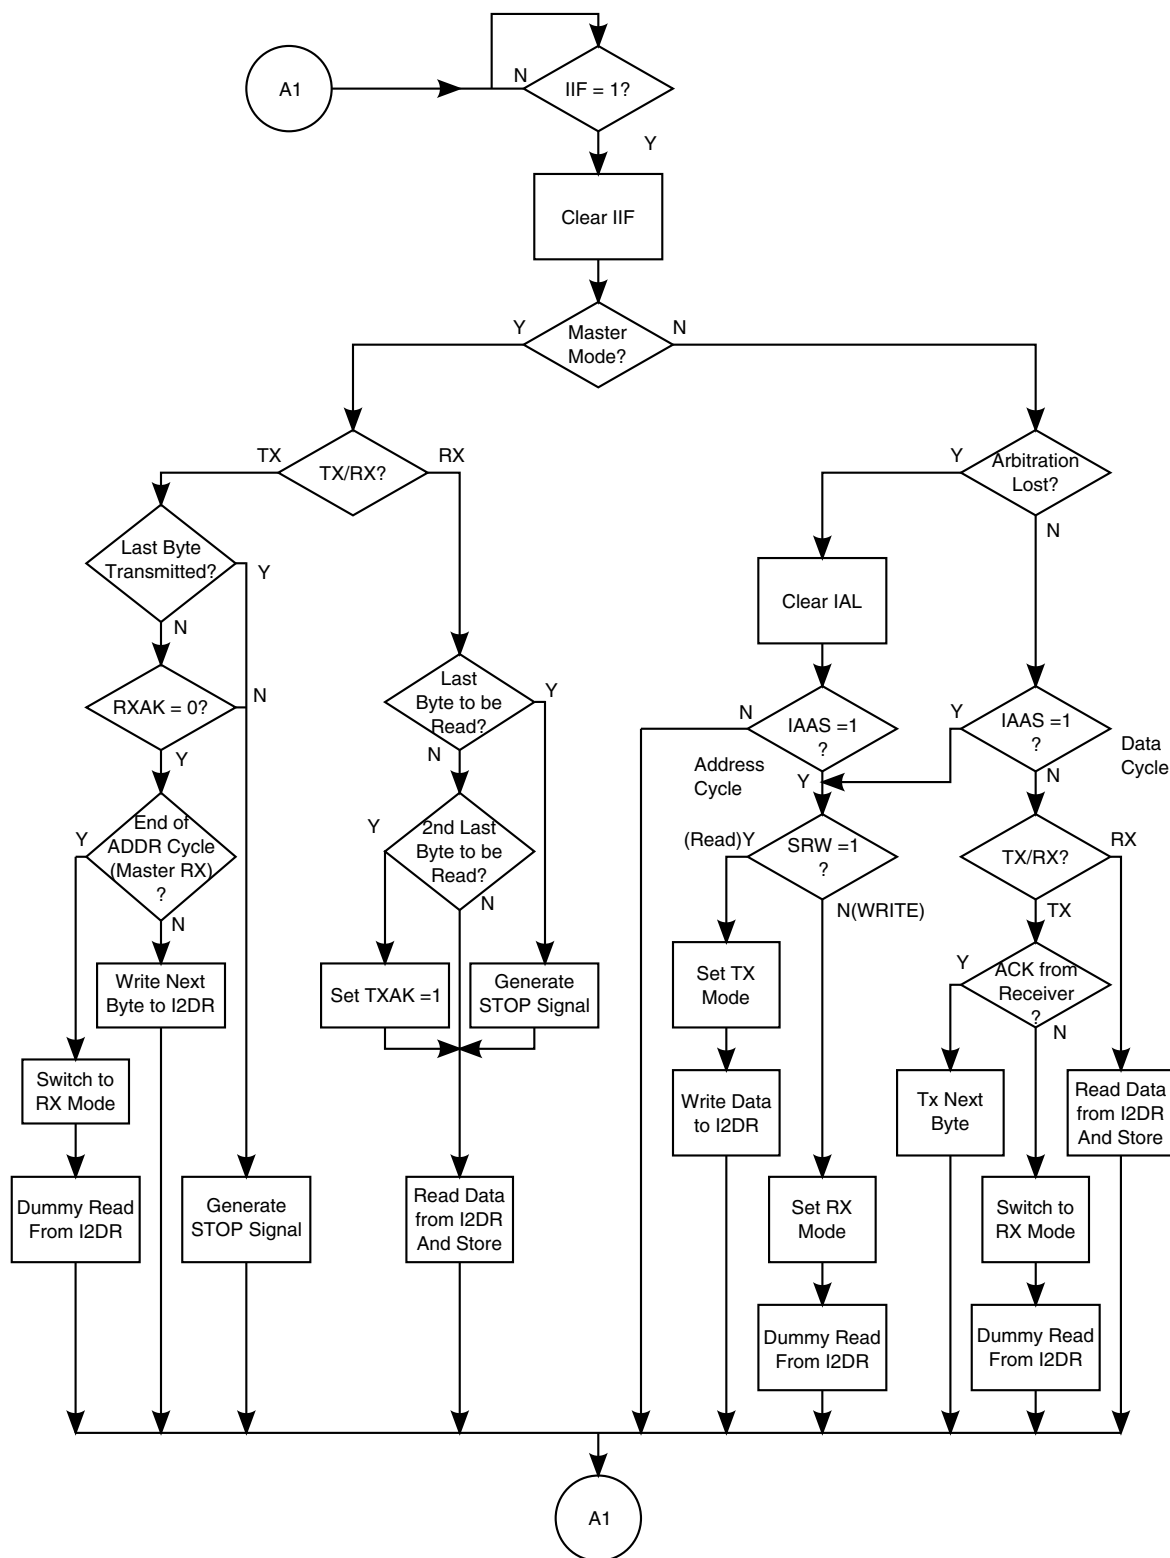

Figure 35-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is $T_{\min} = 25 \mu\text{s}$ ($= 2.5 \times 10 \mu\text{s}$). This value can be calculated for any bus frequency. The formula is $T_{\min} = 10/F_{\text{SCL}}$, where F_{SCL} is the frequency of the I2C clock (SCL).

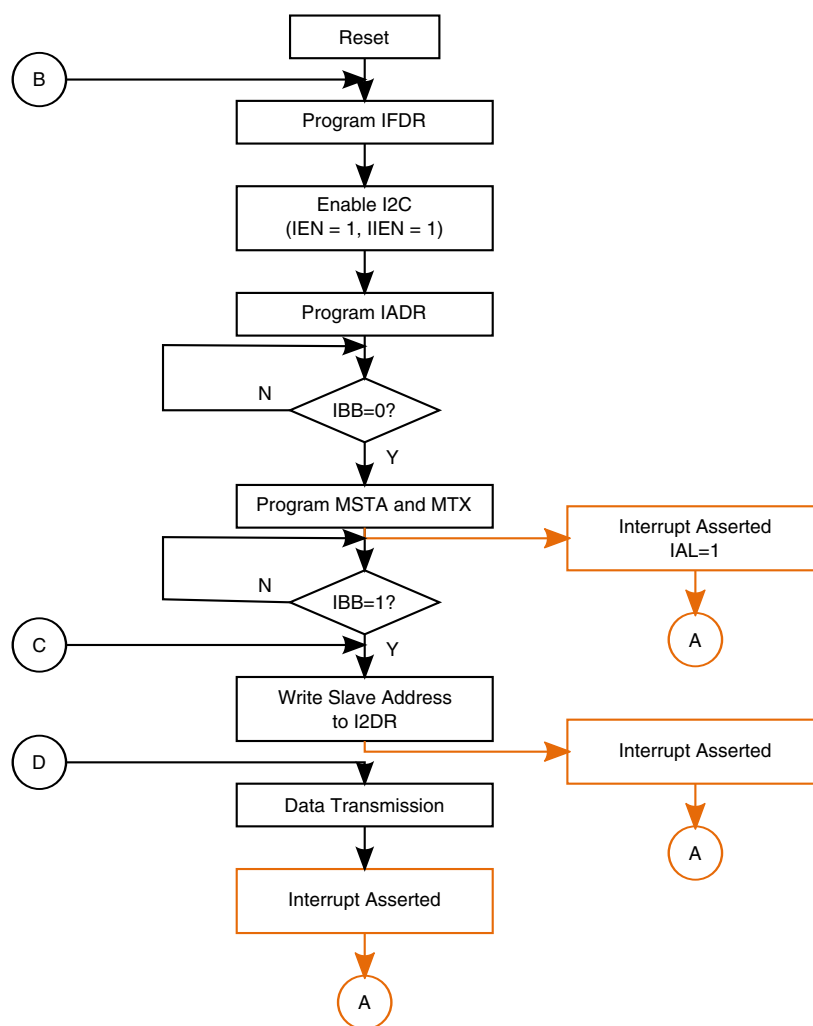

Figure 35-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

Figure 35-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 35-7 and Figure 35-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

35.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

35.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 21A_0000 | I2C Address Register (I2C1_IADR) | 16 | R/W | 0000h | 35.7.1/1885 |
| 21A_0004 | I2C Frequency Divider Register (I2C1_IFDR) | 16 | R/W | 0000h | 35.7.2/1885 |
| 21A_0008 | I2C Control Register (I2C1_I2CR) | 16 | R/W | 0000h | 35.7.3/1887 |
| 21A_000C | I2C Status Register (I2C1_I2SR) | 16 | R/W | 0081h | 35.7.4/1888 |
| 21A_0010 | I2C Data I/O Register (I2C1_I2DR) | 16 | R/W | 0000h | 35.7.5/1890 |
| 21A_4000 | I2C Address Register (I2C2_IADR) | 16 | R/W | 0000h | 35.7.1/1885 |
| 21A_4004 | I2C Frequency Divider Register (I2C2_IFDR) | 16 | R/W | 0000h | 35.7.2/1885 |
| 21A_4008 | I2C Control Register (I2C2_I2CR) | 16 | R/W | 0000h | 35.7.3/1887 |

| 21A_4010 | I2C Data I/O Register (I2C2_I2DR) | 16 | R/W | 0000h | 35.7.5/1890 |
| 21A_8000 | I2C Address Register (I2C3_IADR) | 16 | R/W | 0000h | 35.7.1/1885 |
| 21A_8004 | I2C Frequency Divider Register (I2C3_IFDR) | 16 | R/W | 0000h | 35.7.2/1885 |
| 21A_8008 | I2C Control Register (I2C3_I2CR) | 16 | R/W | 0000h | 35.7.3/1887 |
| 21A_800C | I2C Status Register (I2C3_I2SR) | 16 | R/W | 0081h | 35.7.4/1888 |
| 21A_8010 | I2C Data I/O Register (I2C3_I2DR) | 16 | R/W | 0000h | 35.7.5/1890 |

35.7.2 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|---|---|-----|---|---|---|---|---|---|---|
| Read | 0 | | | | | | | | ADR | | | | | | | 0 |
| Write | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

I2Cx_IADR field descriptions

| Field | Description |
|------------------|--|
| 15–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7–1 ADR | Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. NOTE: The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset. |
| 0 Reserved | This read-only field is reserved and always has the value 0. |

35.7.3 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily be obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

PLL2 = 528MHz

PLL2_PFD2 = 528MHz * 18 / 24 = 396MHz

IPG_CLK_ROOT = (PLL2_PFD2 / ahb_podf) / ipg_podf = (396MHz/4)/2 = 49.5MHz

PER_CLK_ROOT = IPG_CLK_ROOT/perclk_podf = 49.5MHz/1 = 49.5MHz

NOTE

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 35-13. I2C_IFDR Register Field Values

| IC | Divider | | IC | Divider | | IC | Divider | | IC | Divider |
|------|---------|--|------|---------|--|------|---------|--|------|---------|
| 0x00 | 30 | | 0x10 | 288 | | 0x20 | 22 | | 0x30 | 160 |

I2Cx_IFDR field descriptions

| Field | Description |
|------------------|--|
| 15–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5–0 IC | I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. NOTE: The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint. |

35.7.4 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

| | | | | | | | | |
|-------|-----|-----|------|-----|------|------|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| Read | 0 | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | IEN | IEN | MSTA | MTX | TXAK | 0 | 0 | |
| Write | IEN | IEN | MSTA | MTX | TXAK | RSTA | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

I2Cx_I2CR field descriptions

| Field | Description |
|------------------|---|
| 15–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7 IEN | I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect. |
| 6 I2EN | I2C interrupt enable. NOTE: If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set. |
| 5 MSTA | Master/Slave mode select bit. If the master loses arbitration, MSTa is cleared without generating a Stop signal. NOTE: The module clock should be on for writing to the MSTa bit. NOTE: The MSTa bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration. |

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

| Field | Description |
|-----------------|---|
| | 0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode. |
| 4 MTX | Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1. |
| 3 TXAK | Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. NOTE: Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1). |
| 2 RSTA | Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition |
| 1–0 Reserved | This read-only field is reserved and always has the value 0. |

35.7.5 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

| | | | | | | | | |
|-------|-----|------|-----|-----|----|-----|-----|------|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| Read | 0 | | | | | | | |
| Write | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | ICF | IAAS | IBB | IAL | 0 | SRW | IIF | RXAK |
| Write | | | | | | | | |
| Reset | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

I2Cx_I2SR field descriptions

| Field | Description |
|------------------|--|
| 15–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7 ICF | Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer. |
| 6 IAAS | I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address. |
| 5 IBB | I2C bus busy bit. Indicates the status of the bus. NOTE: When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set. |
| 4 IAL | Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. <p>For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle.</p> <ul style="list-style-type: none"> A Start cycle is attempted when the bus is busy. A Repeated Start cycle is requested in Slave mode. A Stop condition is detected when the master did not request it. <p>NOTE: Software cannot set the bit.</p> 0 No arbitration lost. 1 Arbitration is lost. |
| 3 Reserved | This read-only field is reserved and always has the value 0. |
| 2 SRW | Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave |
| 1 IIF | I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. NOTE: The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending. |

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

| Field | Description |
|-----------|--|
| | <p>This causes a processor interrupt request (if the interrupt enable is asserted [I1EN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost. |
| 0 RXAK | <p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.</p> |

35.7.6 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Read | 0 | | | | | | | | DATA | | | | | | | |
| Write | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

I2Cx_I2DR field descriptions

| Field | Description |
|------------------|---|
| 15–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7–0 DATA | <p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p>NOTE: The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p> |

Chapter 36

IOMUX Controller (IOMUXC)

36.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 36-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

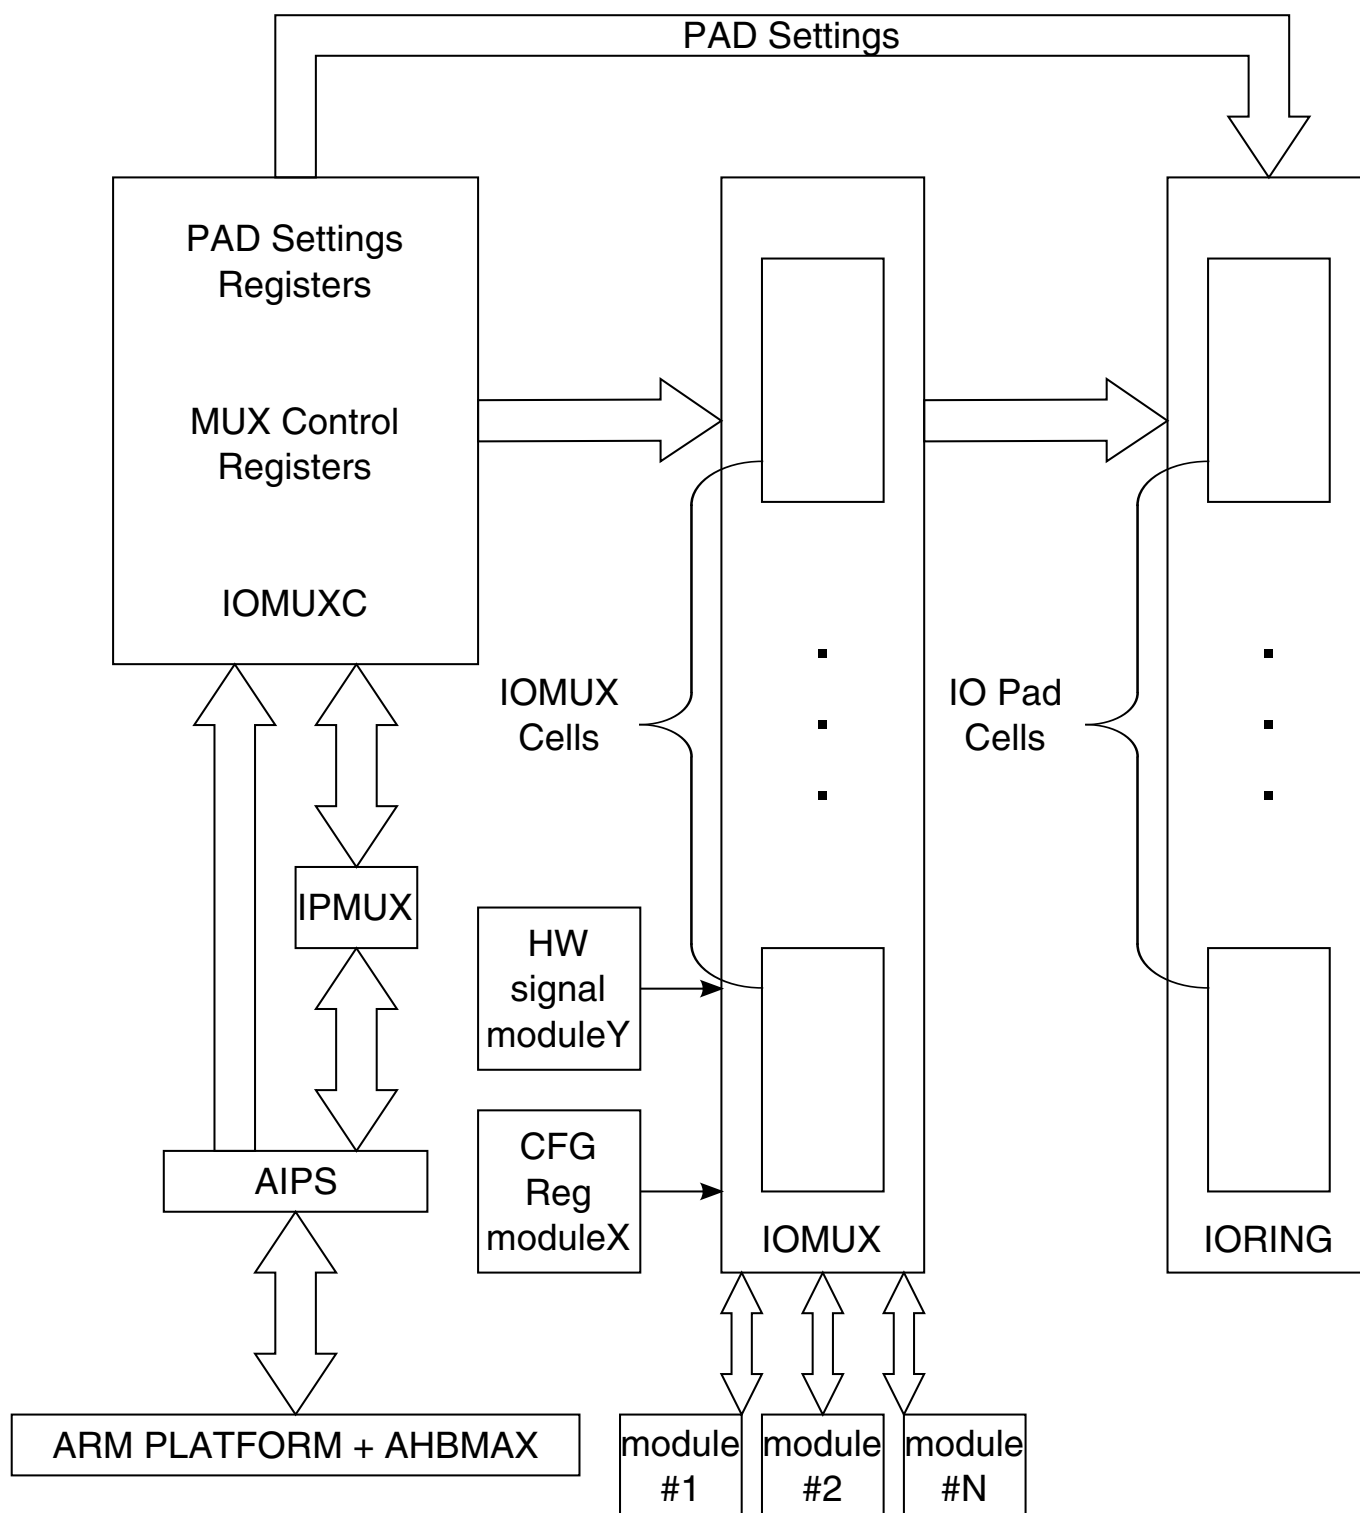

Figure 36-1. IOMUX SoC Level Block Diagram

36.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

36.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 36-1. IOMUXC Clocks

| Clock name | Clock Root | Description |
|------------|---------------|-------------------------|
| ipt_clk_io | enfc_clk_root | IO clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

36.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 36-2](#).

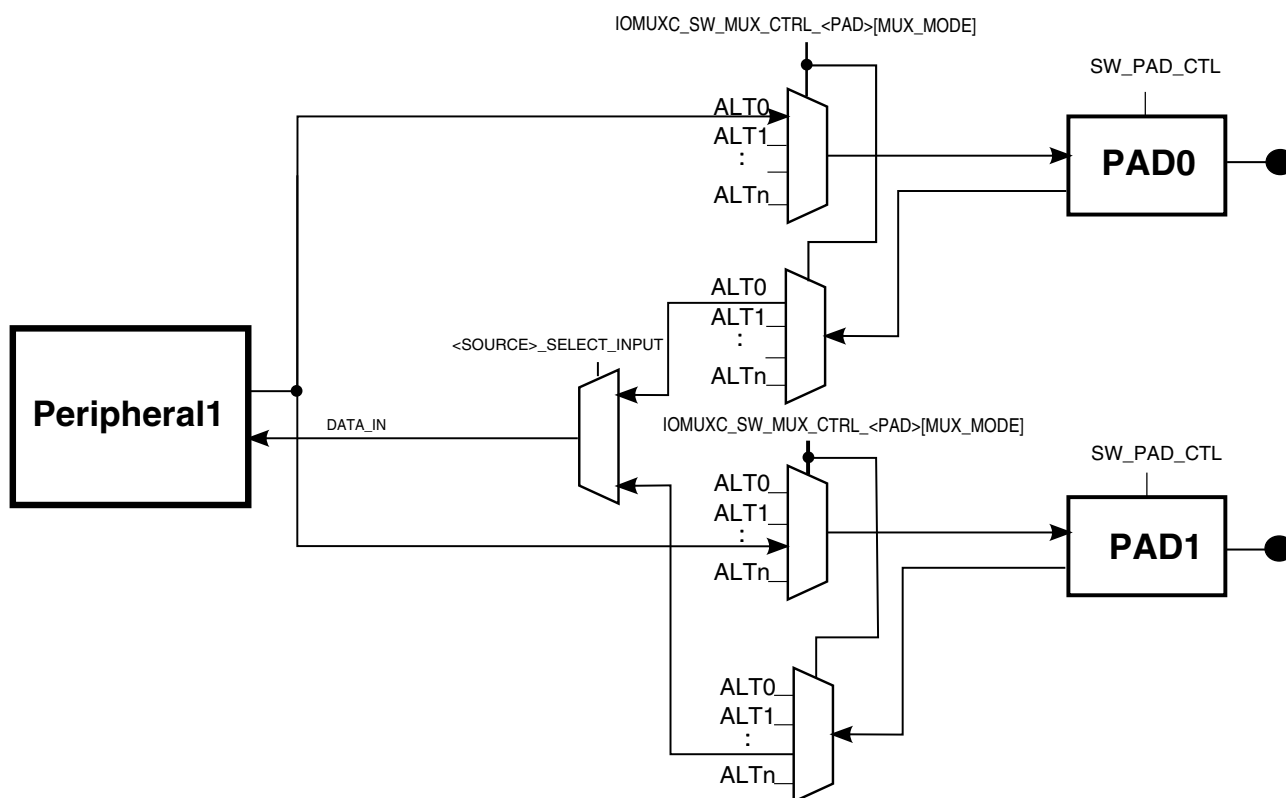

Figure 36-2. IOMUX Cell Block Diagram

36.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

36.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

36.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

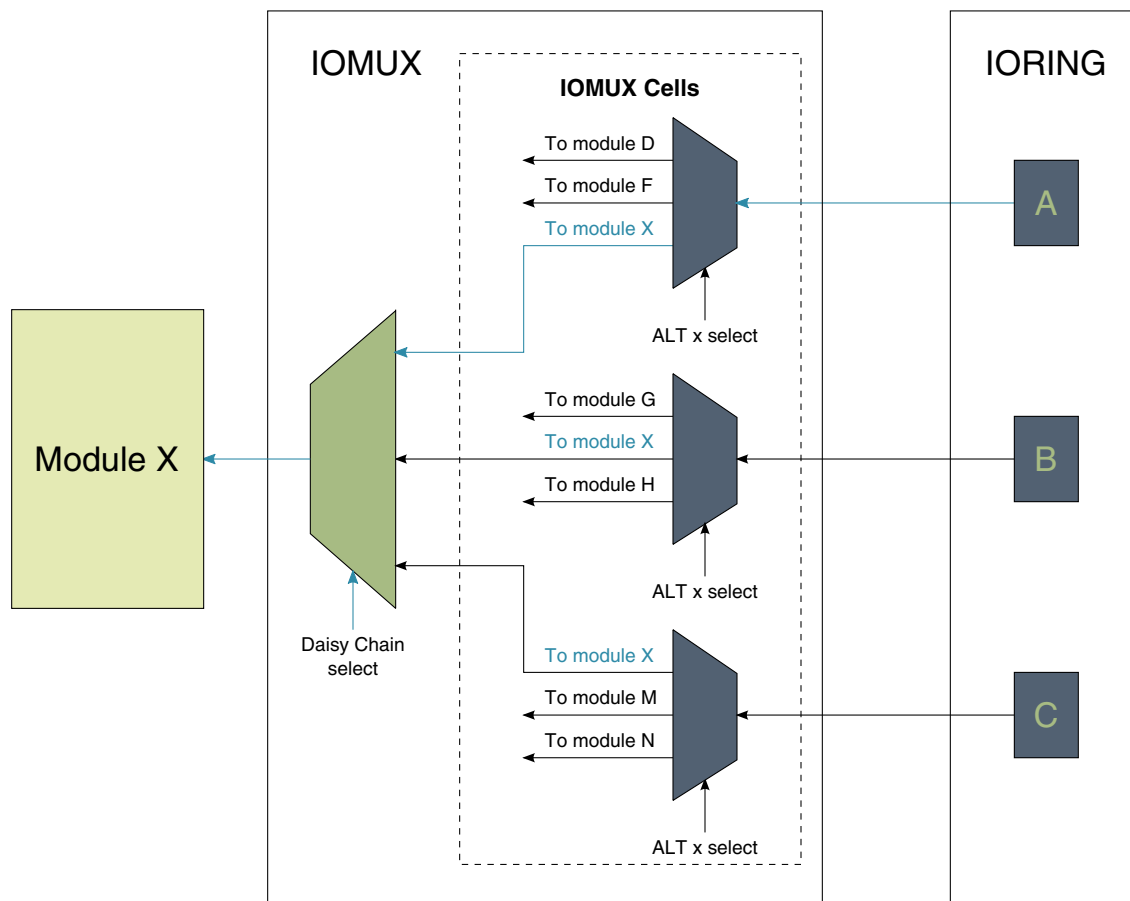

Figure 36-3. Daisy chain illustration

36.4 IOMUXC Memory Map/Register Definition

The main groups of IOMUXC registers are:

The General Purpose Registers IOMUXC_GPR[13:0] are used to select operating modes for general features in the SoC, usually not related to the IOMUX itself.

The Software MUX Control Registers are used to configure the IOMUX muxing, and "connect" the pad to a given port in a module.

The PAD Settings Registers are used to control the pad settings configuration. For some pads (in order to save chip route) the pad settings are grouped in one register; changing the group register will affect the settings for all pads in the group.

The following table shows the IOMUXC register summary.

IOMUXC memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|------------------------------|
| 20E_0000 | GPR (IOMUXC_GPR0) | 32 | R/W | 0000_0000h | 36.4.1/1924 |
| 20E_0004 | GPR (IOMUXC_GPR1) | 32 | R/W | 4840_0005h | 36.4.2/1927 |
| 20E_0008 | GPR (IOMUXC_GPR2) | 32 | R/W | 0000_0000h | 36.4.3/1930 |

IOMUXC_GPR1 field descriptions

| Field | Description |
|-----------------------------|---|
| 31 CFG_L1_CLK_REMOVAL_EN | PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Enable the reference clock removal in L1 state. This is a bit from application register. |
| 30 APP_CLK_REQ_N | PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Indicates that application logic is ready to have reference clock removed. |
| 29 Reserved | This read-only field is reserved and always has the value 0. |
| 28 APP_REQ_EXIT_L1 | PCIe_CTL - Application Request to Exit L1. Request from the application to exit ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set |
| 27 APP_READY_ENTR_L23 | PCIe_CTL - Application Ready to Enter L23. Indication from the application that it is ready to enter the L23 state. 0 PCIe application is not ready to enter L23 1 PCIe application is ready to enter L23 |
| 26 APP_REQ_ENTR_L1 | PCIe_CTL - Application Request to Enter L1. Request from the application to enter ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set |

Table continues on the next page...

IOMUXC_GPR1 field descriptions (continued)

| Field | Description |
|----------------------|---|
| 25 MIPI_COLOR_SW | MIPI color switch control 0 MIPI color switch request is not set 1 MIPI color switch request is set |
| 24 MIPI_DPI_OFF | MIPI DPI shutdown request 0 MIPI DPI shutdown request is not set 1 MIPI DPI shutdown request is set |
| 23 Reserved | This read-only field is reserved and always has the value 0. |
| 22 EXC_MON | Exclusive monitor response select of illegal command (of lal gaskets, except MMDC) 0 OKEY response 1 SLVError (default) |
| 21 ENET_CLK_SEL | ENET TX reference clock 0 get enet tx reference clk from pad (external OSC for both external PHY and Internal Controller) 1 get enet tx reference clk from internal clock from anatop (loopback through pad), this clock also sent out to external PHY |
| 20 MIPI_IPU2_MUX | MIPI sensor to IPU-2 mux control 0 Enable mipi to IPU2 CSI1 - virtual channel is fixed to 3. 1 Enable parallel interface to IPU2 CSI1. |
| 19 MIPI_IPU1_MUX | MIPI sensor to IPU-1 mux control 0 Enable mipi to IPU1 CSI0 - virtual channel is fixed to 0. 1 Enable parallel interface to IPU1 CSI0. |
| 18 TEST_POWERDOWN | PCIe_PHY - All Circuits Power-Down Control Function: Powers down all circuitry in the PHY for IDDQ testing. 0 Power down is not requested 1 Power down is requested |
| 17 IPU_VPU_MUX | IPU-1/IPU-2 to VPU signals control. This control selects between IPU-1 and IPU-2 outputs that are going to the VPU (current buffer, new frame, end of line) 0 IPU-1 is selected 1 IPU-2 is selected |
| 16 REF_SSP_EN | PCIe_PHY - Reference Clock Enable for SS function. Function: Enables the reference clock to the prescaler. The phy_ref_ssp_en signal must remain deasserted until the reference clock is running at the appropriate frequency, at which point phy_ref_ssp_en can be asserted. For lower power states, phy_ref_ssp_en can also be deasserted. 0 PCIe PHY reference clock is disabled 1 PCIe PHY reference clock is enabled |
| 15 USB_EXP_MODE | USB Exposure mode 0 Exposure mode is disabled. 1 Exposure mode is enabled. |
| 14 SYS_INT | PCIe_CTL - When SYS_INT goes from low to high, the core generates an Assert_INTx Message. When sys_int goes from high to low, the core generates a Deassert_INTx Message. |

This can avoid any setup time issue for the read access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI read transaction, i.e., at most 1 more clock cycle for each read burst with multiple beats of data. When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).</p> <p>0 read address pipeline is disabled 1 read address pipeline is enabled</p> <p>OCRAM_CTL[21] - read data wait state control bit</p> |

Table continues on the next page...

IOMUXC_GPR3 field descriptions (continued)

| Field | Description |
|----------------------------|---|
| | <p>When the read data wait state is enabled, it will cost 2 cycles for each read access, (each beat of a read burst). This can avoid the potential timing problem caused by the relatively longer memory access time at higher frequency. When this feature is disabled, it only costs 1 clock cycle to finish a read transaction, i.e., get read data back in the next cycle of read request becomes valid on the bus.</p> <p>0 read data pipeline is disabled 1 read data pipeline is enabled</p> |
| 20–17 OCRAM_ STATUS | <p>This field shows the OCRM pipeline settings status, controlled by OCRM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is:</p> <ul style="list-style-type: none"> • set/clear the control bit • poll the status bit until it goes to 0 <p>OCRAM_STATUS[17] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[19] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[20] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>0 read data pipeline configuration valid 1 read data pipeline control bit changed</p> |
| 16 CORE3_DBG_ ACK_EN | <p>Mask control of Core 3 debug acknowledge to global debug acknowledge</p> <p>0 Core 3 debug acknowledge is part of global acknowledge. 1 Core 3 debug acknowledge is masked by this bit, and it is not part of global acknowledge.</p> |

- Set of the cache bits, enable packet optimization through the bus system to DDR controller. The only side effect is that bus may change the nature of the accesses, which may lead to problems when accessing FIFO type address. In most typical cases, these bits should be set. For the GPU3D, GPU2D and OpenVG, such settings are possible through the IP programming model. For few peripherals, for these bits to take effect, it is required to also select set '1' to 'cache-mux' control bit.

IOMUXC_SW_PAD_CTL_PAD_DRAM_ADDR01 field descriptions

| Field | Description |
|-------------------|--|
| 31–20 Reserved | This read-only field is reserved and always has the value 0. |
| 19–18 DDR_SEL | DDR Select Field |

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_ADDR01 field descriptions (continued)

| Field | Description |
|-----------------|---|
| | This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register. |
| 17 DDR_INPUT | DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A1. 0 CMOS — CMOS input mode. 1 DIFFERENTIAL — Differential input mode. |
| 16 HYS | Hysteresis Enable Field Select one of next values for pad: DRAM_A1. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input |
| 15–14 PUS | Pull Up / Down Config. Field Read Only Field The value of this field is fixed and cannot be changed. 10 100K_OHM_PU — 100K Ohm Pull Up |
| 13 PUE | Pull / Keep Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRPK Note: The value of this field does not reflect the value of the Group Control Register. |
| 12 PKE | Pull / Keep Enable Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRPKE Note: The value of this field does not reflect the value of the Group Control Register. |
| 11 Reserved | This read-only field is reserved and always has the value 0. |
| 10–8 ODT | On Die Termination Field Select one of next values for pad: DRAM_A1. 000 DISABLED — Disabled 001 120_OHM — 120 Ohm ODT 010 60_OHM — 60 Ohm ODT 011 40_OHM — 40 Ohm ODT 100 30_OHM — 30 Ohm ODT 101 24_OHM — 24 Ohm ODT 110 20_OHM — 20 Ohm ODT 111 17_OHM — 17 Ohm ODT |
| 7–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5–3 DSE | Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_ADDDS Note: The value of this field does not reflect the value of the Group Control Register. |
